Service Metadata Locator (SML)

Version: 1.2.0 Status: In use

Editors:

Gert Sylvest (NITA/Avanade) Jens Jakob Andersen (NITA) Klaus Vilstrup Pedersen (DIFI) Mikkel Hippe Brun (NITA) Mike Edwards (NITA/IBM)

	Project co-funded by the European Commission within the ICT Policy Support Programme	
	Dissemination Level	
Р	P Public X	
С	Confidential, only for members of the consortium and the Commission Services	

Revision History

Version	Date	Description of changes	Author
1.0.0	2010-02-15	First version (pending EC approval)	Mike Edwards, NITA/IBM
1.0.1	2010-10-01	EC approved	Klaus Vilstrup Pedersen, DIFI
1.2.0	2021-05-13	Updated the references	Philip Helger,
		Improved layout	OpenPeppol OO
		Linking external XSD and WSDLs in the Appendix	
		Updated rules for migration key	
		Changed the service name from "ManageParticipant*" to "ManageBusiness*" to reflect the current situation

13

14

16

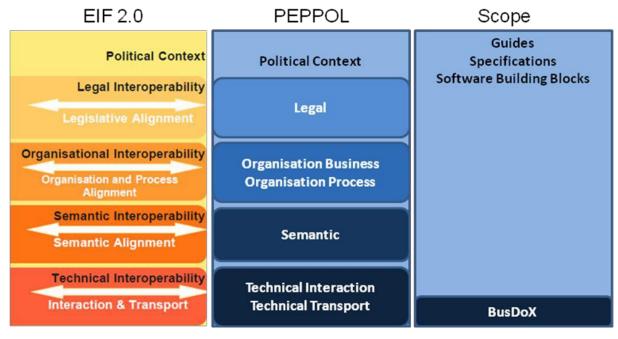

20

22

- 3 This document defines the profiles for the discovery and management interfaces for the Business
- 4 Document Exchange Network (BUSDOX) Service Metadata Locator service.
- 5 The Service Metadata Locator service exposes three interfaces:
 - Service Metadata discovery interface
 This is the lookup interface which enables senders to discover service metadata about specific target participants
 - Manage participant identifiers interface
 This is the interface for Service Metadata publishers for managing the metadata relating to specific participant identifiers that they make available.
 - Manage service metadata interface
 This is the interface for Service Metadata publishers for managing the metadata about their services, e.g. binding, interface profile and key information.
- 15 This document describes the physical bindings of the logical interfaces in section 3.1.

1.2 Scope

- 17 This specification relates to the Technical Transport Layer i.e. BusDox specifications. The BusDox
- specifications can be used in many interoperability settings. In the Peppol context, it provides
- transport for procurement documents as specified in the Peppol Profiles.

21 Fig. 1: Peppol Interoperability

1.3 Goals and non-goals

- 23 The goal of this document is to describe the interface and transport bindings of the Service Metadata
- 24 Locator (SML) service. It does not consider its implementation or internal data formats, user
- 25 management and other procedures related to the operation of this service.

1.4 Terminology

26

30

47

49

52

54

56

58

59

62

64

66

68

- 27 The keywords "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD
- 28 NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as
- 29 described in RFC 2119 [RFC2119].

1.4.1 Notational conventions

- 31 Pseudo-schemas are provided for each component, before the description of the component. They
- 32 use BNF-style conventions for attributes and elements: "?" denotes optionality (i.e. zero or one
- occurrences), "*" denotes zero or more occurrences, "+" one or more occurrences, "[" and "]" are
- used to form groups, and "|" represents choice. Attributes are conventionally assigned a value which
- 35 corresponds to their type, as defined in the normative schema. Elements with simple content are
- 36 conventionally assigned a value which corresponds to the type of their content, as defined in the
- 37 normative schema. Pseudo schemas do not include extension points for brevity.

```
38
     <!-- sample pseudo-schema -->
39
     <defined element
40
         required attribute of type string="xs:string"
41
         optional attribute of type int="xs:int"? >
42
       <required element />
43
       <optional element />?
44
       <one_or_more_of_these_elements />+
       [ <choice 1 /> | <choice 2 /> ]*
45
     </defined element>
46
```

2 The Service Discovery Process

- 77 The interfaces of the Service Metadata Locator (SML) service and the Service Metadata Publisher
- 78 (SMP) service cover both sender-side lookup and metadata management performed by SMPs.
- 79 BUSDOX mandates the following interfaces for these services:
 - Service Metadata Locator:

76

80

81

82

84

92

- Discovery interface for senders
- Management interface for SMPs
- Service Metadata Publishers:
 - Discovery interface for senders
- 85 This specification only covers the interfaces for the Service Metadata Locator.
- 86 The Service Metadata Locator service specification is based on the use of DNS (Domain Name
- 87 System) lookups to find the address of the Service Metadata for a given participant ID [DNS-1034]
- 88 [DNS-1035]. This approach has the advantage that it does not need a single central server to run the
- 89 Discovery interface, with its associated single point of failure. Instead, the already distributed and
- 90 highly redundant infrastructure which supports DNS is used. The SML service itself thus plays the role
- 91 of providing controlled access to the creation and update of entries in the DNS.

2.1 Discovery flow

- 93 For a sender, the first step in the Discovery process is to establish the location of the Service
- 94 Metadata relating to the particular Participant Identifier to which the sender wants to transmit a
- 95 message. Each participant identifier is registered with one and only one Service Metadata Publisher.
- 96 The sender constructs the address for the service metadata for a given recipient participant identifier
- 97 using a standard format, as follows:
- 98 http://<hash over recipientID>.<schemeID>.<SML
- 99 | domain>/<recipientID>/services/<documentType>
- 100 The sender uses this URL in an HTTP GET operation which returns the metadata relating to that
- recipient and the specific document type (for details, see the Service Metadata Publishing
- specification [BDEN-SMP]). The sender can obtain the information necessary to transmit a message
- containing that document type to that recipient from the returned metadata. This sequence is shown
- 104 in Fig. 2.
- Note that the sender is required to know 2 pieces of information about the recipient the recipient's
- participant ID and the ID of the Scheme of the participant ID (i.e. the format or type of the
- participant ID). This provides for flexibility in the types of participant identifier that can be used in the
- 108 system. Since in general a participant ID may not have a format that is acceptable in an HTTP URL,
- the ID is hashed into a string as described in section 3.1.1 Format of Participant Identifiers.

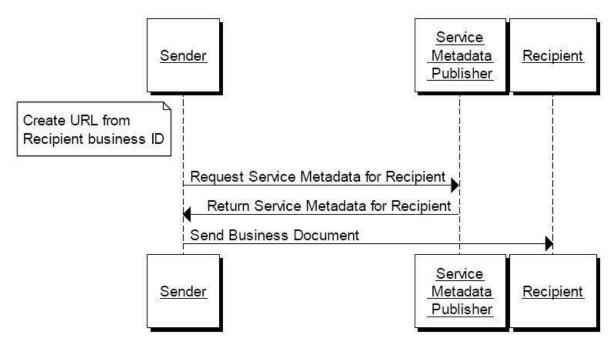

Fig. 2: Sequence Diagram for Sender transmitting Document to Recipient

The underlying design of the Discovery process is based on the use of Domain Name System (DNS) CNAME records which correspond to the Domain Name in the format given above, namely that there is a CNAME record for the domain name .<schemeID>.<sml domain>. Furthermore, that CNAME record points at the Service Metadata Publisher which holds the metadata about that recipient. This means that an address lookup for the domain name by the sender naturally resolves to the Service Metadata Publisher holding the metadata. The resolution of Web URLs in this way is a fundamental part of the World Wide Web and so it is based on standard technology that it available to all users.

2.2 Flows Relating to Service Metadata Publishers

The management of the DNS CNAME records for a given participant identifier is performed through the Management interface of the Service Metadata Locator. The management interface is primarily for use by the Service Metadata Publisher which controls the service metadata for a given participant identifier. Note that the DNS CNAME records are **not** manipulated directly by the Service Metadata Publisher, but are manipulated by the Service Metadata Locator service following requests made to its Management interface. The basic process steps for the SMP to manipulate the metadata relating to a given participant are shown in Fig. 3.

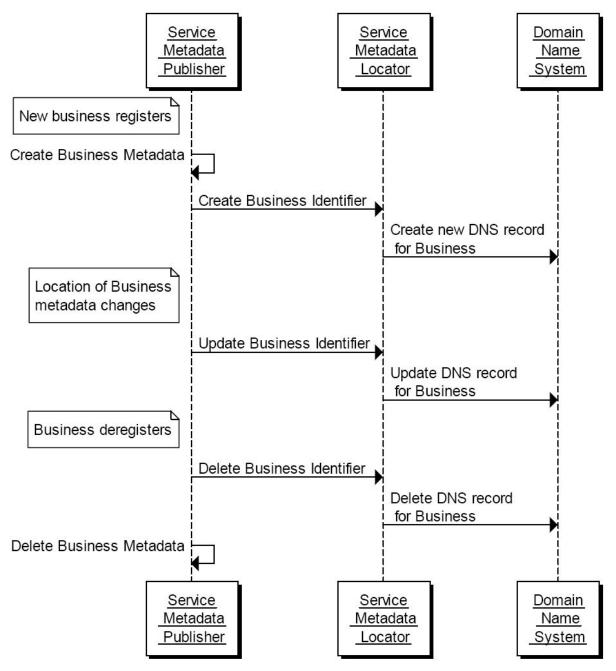

Fig. 3: Sequence Diagram for Service Metadata Publisher Adding, Updating and Removing Metadata for a Participant

Each Service Metadata Publisher is required to register the address of its server with the Service Metadata Locator. Only once this has been done can information relating to specific Participant Identifiers be presented to the SML. The address for the metadata for a given participant is tied to the address of the SMP with which the participant is registered. For this purpose, the SMP uses the ManageServiceMetadata interface with flows as shown in Fig. 4.

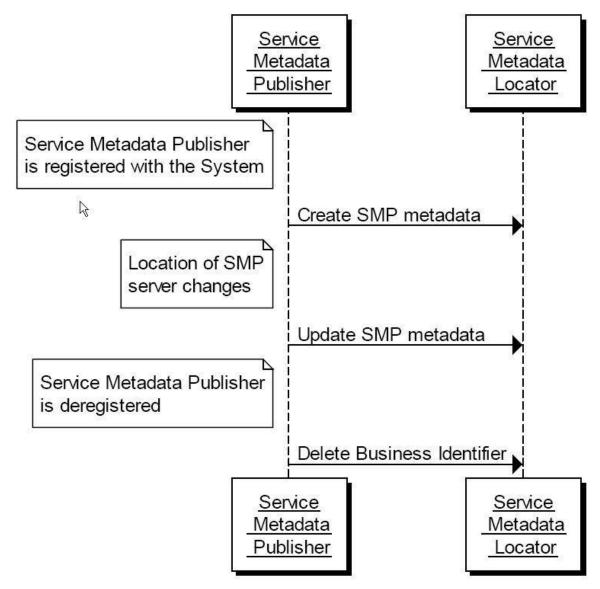

Fig. 4: Service Metadata Publisher use of the ManageServiceMetadata

Another set of steps relating to SMPs and the SML relates to the migration of the metadata about a participant from one SMP to another SMP (for example, the participant decides to change suppliers for this function). There are interfaces to the SML to support migrations of this kind, which imply following a sequence of steps along the lines shown in Fig. 5.

In this sequence, the original SMP receives a request from a participant to migrate its metadata to a new SMP (a step that is done out-of-band: there are no interfaces defined in these specifications for this). The original SMP generates a "Migration Key" and invokes the PrepareToMigrate operation of the SML and then passes the Migration Key to the new SMP (the key passing is an out-of-band step not defined in these specifications). When the new SMP has created the relevant metadata for the participant, it signals that it is taking over by invoking the Migrate operation of the SML, which then causes the DNS record(s) for that participant ID to be updated to point at the new SMP. Once this switch is complete, the original SMP can remove the metadata which it holds for the participant.

The following rules apply to the Migration Key

• MUST have at least 8 characters and not more than 24 characters

- MUST contain at least 2 lower case characters (a-z)
 - MUST contain at least 2 upper case characters (A-Z)
 - MUST contain at least 2 digits (0-9)

153

154

155

156

157158

159160

- MUST contain at least 2 characters from this set: "@" (ASCII code 64), "#" (35), "\$" (36), "%" (37), "(" (40), ")" (41), "[" (91), "]" (93), "{" (123), "}" (125), "*" (42), "^" (94), "-" (45), "!" (33), "~" (126), "|" (124), "+" (43) and "=" (61)
- MUST NOT contain whitespace characters

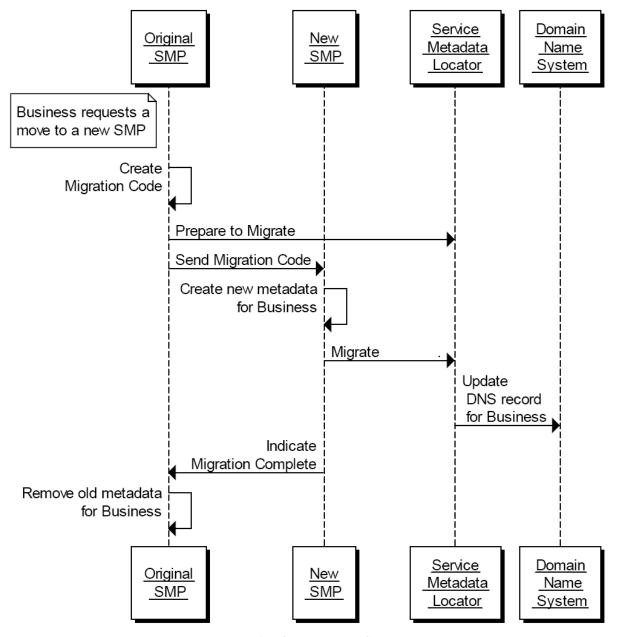

Fig. 5: Steps in Migrating Metadata for a Participant from one SMP to a new SMP

3 Interfaces and Data Model

This section outlines the service interfaces and the related data model.

3.1 Service Metadata Locator Service, logical interface

- 164 The Service Metadata Locator Service interface is divided into 2 logical parts:
- Manage participant identifiers interface
 This is the interface for Service Metadata Publishers for managing the registered participant identifiers they expose.
- Manage service metadata interface
 This is the interface for Service Metadata Publishers for managing the metadata about their metadata publishing service, e.g. binding, interface profile and key information.

171 3.1.1 Format of Participant Identifiers

- 172 BUSDOX functions by means of logical addresses for the metadata of services offered by a
- participant, of the form:

161

163

- 174 http://<hash over recipientID>.<schemeID>.<SML
- 175 | domain>/<recipientID>/services/<documentType>
- 176 BUSDOX is flexible with regard to the use of any one of a wide range of schemes for the format of
- participant identifiers, represented by the schemeID. However, when using this form of HTTP Web
- address, which is resolved through the DNS system, the format of the recipientID and the
- 179 schemeID is constrained by the requirements of the DNS system. This means that both the
- 180 recipientID and the schemeID must be strings which use the ASCII alphanumeric characters
- only and which have to start with an alphabetic character.
- BUSDOX allocates schemeIDs to conform to this requirement. However, there is no guarantee that
- the participant IDs will conform to this requirement for any given scheme (remembering that in
- many cases the participant ID scheme will be a pre-existing scheme with its own format rules that
- might violate the requirements of a DNS name). Therefore a hash of the participant ID is always used,
- using the MD5 hash algorithm [MD5], and prefixed by "B-".
- An example participant ID is 0010:579800000001, for which the MD5 hash is
- e49b223851f6e97cbfce4f72c3402aac. See POLICY 7 of the [PFUOI4] for details.

189 3.1.2 ManageBusinessIdentifier interface

- 190 The ManageBusinessIdentifier interface allows Service Metadata Publishers to manage the
- information in the Service Metadata Locator Service relating to individual participant identifiers for
- which they hold metadata.
- 193 This interface requires authentication of the Service Metadata Publisher. The identity of the Service
- 194 Metadata Publisher derived from the authentication process identifies the Service Metadata
- 195 Publisher associated with the Participant Identifier(s) which are managed via this interface.
- 196 It is possible for a given Service Metadata Publisher to provide the metadata for all participant
- identifiers belonging to a particular participant identifier scheme. If this is the case, then it
- 198 corresponds to the concept of a "wildcard" CNAME record in the DNS, along the lines:
- 199 *.<schemeID>.<SML domain> CNAME <SMP domain>
- 200 <SMP domain> may either be the domain name associated with the SMP, or an alias for it.

- This implies that all participant identifiers for that schemeID will have addresses that resolve to the single address of that one SMP and that as result only one SMP can handle the metadata for all participant identifiers of that scheme. Wildcard records are indicated through the use of "*" as the participant identifier in the operations of the ManageBusinessIdentifier interface.
- The ManageBusinessIdentifier interface has the following operations:
- 206 Create
- 207 CreateList
- 208 Delete
- DeleteList
- PrepareToMigrate
- 211 Migrate
- 212 List
- 213 **Create()**
- 214 Creates an entry in the Service Metadata Locator Service for information relating to a specific
- 215 participant identifier. Regardless of the number of services a recipient exposes, only one record
- 216 corresponding to the participant identifier is created in the Service Metadata Locator Service by the
- 217 Service Metadata Publisher which exposes the services for that participant.
- Input CreateParticipantIdentifier:
 ServiceMetadataPublisherServiceForParticipantType
 contains the Participant Identifier for a given participant and the identifier of the SMP which
 holds its data
- Fault: notFoundFault
- 223 returned if the identifier of the SMP could not be found
- Fault: unauthorizedFault
- returned if the caller is not authorized to invoke the Create operation
- Fault: badRequestFault
- 227 returned if the supplied CreateParticipantIdentifier does not contain consistent
 228 data
- 220 4410
- Fault: internalErrorFault

 230 returned if the SML service is unable to process the request for any reason
- 231 CreateList()
- 232 Creates a set of entries in the Service Metadata Locator Service for information relating to a list of
- 233 participant identifiers. Regardless of the number of services a recipient exposes, only one record
- corresponding to each participant identifier is created in the Service Metadata Locator Service by the
- 235 Service Metadata Publisher which exposes the services for that participant.
- Input CreateList: ParticipantIdentifierPage

 237 contains the list of Participant Identifiers for the participants which are added to the Service

 238 Metadata Locator Service. The NextPageIdentifier element is absent.
- Fault: notFoundFault
- returned if the identifier of the SMP could not be found

- 241 Fault: unauthorizedFault 242 returned if the caller is not authorized to invoke the CreateList operation 243 • Fault: badRequestFault returned if the supplied CreateList does not contain consistent data 244 245 Fault: internalErrorFault returned if the SML service is unable to process the request for any reason 246 247 Delete() 248 Deletes the information that the SML Service holds for a specific Participant Identifier. 249 Input DeleteParticipantIdentifier: 250
 - Input DeleteParticipantIdentifier: ServiceMetadataPublisherServiceForParticipantType contains the Participant Identifier for a given participant and the identifier of the SMP that publishes its metadata
- Fault: notFoundFault
 returned if the participant identifier or the identifier of the SMP could not be found
- Fault: unauthorizedFault
 returned if the caller is not authorized to invoke the Delete operation
- Fault: badRequestFault

 258 returned if the supplied DeleteParticipantIdentifier does not contain consistent

 259 data
 - Fault: internalErrorFault returned if the SML service is unable to process the request for any reason

262 **DeleteList()**

251

252

260

261

264

265266

- 263 Deletes the information that the SML Service holds for a list of Participant Identifiers.
 - Input DeleteList: ParticipantIdentifier contains the list of Participant Identifiers for the participants which are removed from the Service Metadata Locator Service. The NextPageIdentifier element is absent.
- Fault: notFoundFault
 returned if one or more participant identifiers or the identifier of the SMP could not be found
- Fault: unauthorizedFault

 270 returned if the caller is not authorized to invoke the DeleteList operation
- Fault: badRequestFault
 returned if the supplied DeleteList does not contain consistent data
- Fault: internalErrorFault
 returned if the SML service is unable to process the request for any reason

275 **PrepareToMigrate()**

Prepares a Participant Identifier for migration to a new Service Metadata Publisher. This operation is called by the Service Metadata Publisher which currently publishes the metadata for the Participant Identifier. The Service Metadata Publisher supplies a Migration Code which is used to control the migration process. The Migration Code must be passed (out of band) to the Service Metadata Publisher which is taking over the publishing of the metadata for the Participant Identifier and which MUST be used on the invocation of the Migrate () operation.

- This operation can only be invoked by the Service Metadata Publisher which currently publishes the metadata for the specified Participant Identifier.
 - Input PrepareMigrationRecord: MigrationRecordType contains the Migration Key and the Participant Identifier which is about to be migrated from one Service Metadata Publisher to another.
 - Fault: notFoundFault returned if the participant identifier or the identifier of the SMP could not be found
- Fault: unauthorizedFault
 returned if the caller is not authorized to invoke the PrepareToMigrate operation
- Fault: badRequestFault
 returned if the supplied PrepateMigrationRecord does not contain consistent data
- Fault: internalErrorFault
 returned if the SML service is unable to process the request for any reason

295 Migrate()

284

285286

287288

- 296 Migrates a Participant Identifier already held by the Service Metadata Locator Service to target a new
- 297 Service Metadata Publisher. This operation is called by the Service Metadata Publisher which is
- taking over the publishing for the Participant Identifier. The operation requires the new Service
- 299 Metadata Publisher to provide a migration code which was originally obtained from the old Service
- 300 Metadata Publisher.
- The PrepareToMigrate () operation MUST have been previously invoked for the supplied
- Participant Identifier, using the same MigrationCode, otherwise the Migrate () operation fails.
- Following the successful invocation of this operation, the lookup of the metadata for the service
- 304 endpoints relating to a particular Participant Identifier will resolve (via DNS) to the new Service
- 305 Metadata Publisher.
 - Input CompleteMigrationRecord: MigrationRecordType contains the Migration Key and the Participant Identifier which is to be migrated from one Service Metadata Publisher to another.
- Fault: notFoundFault
 310 returned if the migration key or the identifier of the SMP could not be found
- Fault: unauthorizedFault
 returned if the caller is not authorized to invoke the Migrate operation
- Fault: badRequestFault

 returned if the supplied CompleteMigrationRecord does not contain consistent data
- Fault: internalErrorFault
 returned if the SML service is unable to process the request for any reason

317 **List()**

306

307

- List() is used to retrieve a list of all participant identifiers associated with a single Service
- Metadata Publisher, for synchronization purposes. Since this list may be large, it is returned as pages of data, with each page being linked from the previous page.
- 321 Input Page: PageRequest
- 322 contains a PageRequest containing the ServiceMetadataPublisherID of the SMP

323 324		and (if required) an identifier representing the next page of data to retrieve. If the NextPageIdentifier is absent, the first page is returned.
325 326 327 328	•	Output: ParticipantIdentifierPage a page of Participant Identifier entries associated with the Service Metadata Publisher, also containing a <page></page> element containing the identifier that represents the next page, if any.
329 330	•	Fault: notFoundFault returned if the next page or the identifier of the SMP could not be found
331 332	•	Fault: unauthorizedFault returned if the caller is not authorized to invoke the List operation
333 334	•	Fault: badRequestFault returned if the supplied NextPage does not contain consistent data
335 336	•	Fault: internalErrorFault returned if the SML service is unable to process the request for any reason
337 338 339	subseq	nat the underlying data may be updated between one invocation of $\mathtt{List}()$ and a uent invocation of $\mathtt{List}()$, so that a set of retrieved pages of participant identifiers may not ent a consistent set of data.
340	3.1.3	ManageServiceMetadata interface
341 342 343	held in	anageServiceMetadata interface allows Service Metadata Publishers to manage the metadata the Service Metadata Locator Service about their service metadata publisher services, e.g. g, interface profile and key information.
344 345 346	authen	terface requires authentication of the user. The identity of the user derived from the tication process identifies the Service Metadata Publisher associated with the service at which is managed via this interface.
347	The Ma	anageServiceMetadata interface has the following operations:
348	•	Create
349	•	Read
350	•	Update
351	•	Delete
352	Create	0
353 354 355		shes a Service Metadata Publisher metadata record, containing the metadata about the Metadata Publisher, as outlined in the ServiceMetadataPublisherService data
356 357 358 359 360	•	Input CreateServiceMetadataPublisherService: ServiceMetadataPublisherService contains the service metadata publisher information, which includes the logical and physical addresses for the SMP (Domain name and IP address). It is assumed that the ServiceMetadataPublisherID has been assigned to the calling user out-of-bands.
361 362	•	Fault: unauthorizedFault returned if the caller is not authorized to invoke the Create operation

363 364 365	• Fault: badRequestFault returned if the supplied CreateServiceMetadataPublisherService does not contain consistent data
366 367	 Fault: internalErrorFault returned if the SML service is unable to process the request for any reason
368	Read()
369	Retrieves the Service Metadata Publisher record for the Service Metadata Publisher.
370 371 372	 Input ReadServiceMetadataPublisherService: ServiceMetadataPublisherID the unique ID of the Service Metadata Publisher for which the record is required
373 374 375	 Output: ServiceMetadataPublisherService the service metadata publisher record, in the form of a ServiceMetadataPublisherService data type
376 377	 Fault: notFoundFault returned if the identifier of the SMP could not be found
378 379	 Fault: unauthorizedFault returned if the caller is not authorized to invoke the Read operation
380 381	 Fault: badRequestFault returned if the supplied parameter does not contain consistent data
382 383	 Fault: internalErrorFault returned if the SML service is unable to process the request for any reason
384	Update()
385	Updates the Service Metadata Publisher record for the Service Metadata Publisher
386 387 388 389	 Input UpdateServiceMetadataPublisheServicer: ServiceMetadataPublisherService contains the service metadata for the service metadata publisher, which includes the logical and physical addresses for the SMP (Domain name and IP address)
390 391	 Fault: notFoundFault returned if the identifier of the SMP could not be found
392 393	 Fault: unauthorizedFault returned if the caller is not authorized to invoke the Update operation
394 395 396	• Fault: badRequestFault returned if the supplied UpdateServiceMetadataPublisheServicer does not contain consistent data
397 398	 Fault: internalErrorFault returned if the SML service is unable to process the request for any reason
399	Delete()
400	Deletes the Service Metadata Publisher record for the Service Metadata Publisher
401 402 403	 Input DeleteServiceMetadataPublisherService: ServiceMetadataPublisherID the unique ID of the Service Metadata Publisher to delete

• Fault: notFoundFault

returned if the identifier of the SMP could not be found

• Fault: unauthorizedFault

returned if the caller is not authorized to invoke the Delete operation

• Fault: badRequestFault

returned if the supplied DeleteServiceMetadataPublisherService does not

contain consistent data

• Fault: internalErrorFault

returned if the SML service is unable to process the request for any reason

413 3.1.4 Fault Descriptions

414 SMP Not Found Fault

405

407

409

410

412

[action]	http://busdox.org/2010/02/locator/fault
Code	Sender
Subcode	notFoundFault
Reason	The identifier of the SMP supplied could not be found by the SML
Detail	As detailed by the SML

415 Unauthorized Fault

[action]	http://busdox.org/2010/02/locator/fault
Code	Sender
Subcode	unauthorizedFault
Reason	The caller is not authorized to perform the operation requested
Detail	As detailed by the SML

416 Bad Request Fault

[action]	http://busdox.org/2010/02/locator/fault
Code	Sender
Subcode	badRequestFault
Reason	The operation request was incorrect in some way
Detail	As detailed by the SML

417 Internal Error Fault

[action]	http://busdox.org/2010/02/locator/fault
Code	Sender
Subcode	internalErrorFault
Reason	The SML encountered an error while processing the request
Detail	As detailed by the SML

3.2 Service Metadata Locator - data model

- 419 The data model for the Service Metadata Locator involves the following data types:
- ServiceMetadataPublisher
- RecipientParticipantIdentifier
- ParticipantIdentifierPage
- 423MigrationRecord

418

434

435

436

437

438 439

444

452

453 454

455

456

457

424 Each of these data types is described in detail in the following subsections.

425 3.2.1 ServiceMetadataPublisherService datatype

426 Represents a Metadata Publisher Service.

- 433 ServiceMetadataPublisherService has the following sub-elements:
 - PublisherEndpoint (1..1): PublisherEndpointType
 the technical endpoint address of the Service Metadata Publisher, which can be used to
 query information about particular participant identifiers. ServiceEndpointList is a type
 defined in the ServiceMetadataPublishingTypes Schema. The PublisherEndpoint
 element may be a domain name or an IP address of the SMP, or a wildcard expression based
 on the domain name.
- ServiceMetadataPublisherID (1..1): xs:string
 holds the Unique Identifier of the SMP. When creating a
 ServiceMetadataPublisherService record, it is assumed that the publisher ID has been obtained out of band.

3.2.2 ServiceMetadataPublisherServiceForParticipant datatype

Represents a Metadata Publisher Service containing information about a particular Participant Identifier.

- 451 ServiceMetadataPublisherService has the following subelements:
 - ServiceMetadataPublisherID (1..1): xs:string holds the Unique Identifier of the SMP.
 - ParticipantIdentifier (1..1): ids:ParticipantIdentifierType the Participant Identifier which has its services registered in the Service Metadata Publisher. See the "ParticipantIdentifier" section on the format.

3.2.3 ParticipantIdentifier datatype

458 Represents a Participant Identifier which has its service metadata held by a specific Service Metadata 459 Publisher.

- 463 ParticipantIdentifier has the following sub elements:
- ParticipantIdentifier (1..1): xs:string
 the participant identifier
- 468 3.2.4 ParticipantIdentifier format
- 469 For a description of the ParticipantIdentifier format, see the "Peppol Policy for use of Identifier"
- 470 document [PFUOI4].
- 471 3.2.5 ParticipantIdentifierPage datatype
- 472 Represents a page of ParticipantIdentifiers for which data is held by the Service Metadata
- 473 Locator service.

- ServiceMetadataPublisherID (1..1): xs:string
 holds the Unique Identifier of the SMP
- ids:ParticipantIdentifier (1..1): xs:string
 the participant identifier
- NextPageIdentifier (0..1): xs:string

 484 an element containing a string identifying the next page of ParticipantIdentifiers:

```
485 <NextPageIdentifier>
486 [ Identifier for_Next_Page ]
487 </NextPageIdentifier>
```

- 488 If no <NextPageIdentifier/> element is present, it implies that there are no further pages.
- 489 3.2.6 MigrationRecord
- 490 The MigrationRecord represents the data required to control the process of migrating a
- 491 ParticipantIdentifier from the control of one Service Metadata Publisher to a different Service
- 492 Metadata Publisher.

- 498 MigrationRecord has the following sub elements:
- ServiceMetadataPublisherID (1..1): xs:string holds the Unique Identifier of the SMP.

501	•	ParticipantIdentifier	(11)	:	<pre>ids:ParticipantIdentifierType</pre>
502		the participant identifier			

•	MigrationKey (11) : xs:string
	a string which is a unique key controlling the migration of the metadata for a given
	ParticipantIdentifier from one Service Metadata Publisher to another. The
	MigrationKey string is a string of characters and numbers only, with a maximum length
	of 24 characters.

508 4 Service Bindings

- 509 This section describes the Bindings of the services provided by the Service Metadata Locator to
- 510 specific transports.

511 4.1 Services Provided as Web services - characteristics

- 512 Some of the services described by this specification are provided through Web service bindings.
- 513 Where services are provided through Web services bindings, those bindings MUST conform to the
- relevant WS-I Profiles, in particular WS-I Basic Profile 1.1 and WS-I Basic Security Profile 1.0.

515 **4.2 ManageBusinessIdentifier service - binding**

The ManageBusinessIdentifier service is provided in the form of a SOAP-based Web service.

517 **4.2.1 Transport binding**

- 518 The ManageBusinessIdentifier interface is bound to an HTTP SOAP 1.1 transport.
- See a WSDL for this in "Appendix B: WSDLs".

520 **4.2.2 Security**

- The service is secured at the transport level with a two-way SSL/TLS connection. The requestor must
- authenticate using a client certificate issued for use in the infrastructure by a trusted third-party. For
- example, in the Peppol infrastructure, a Peppol certificate will be issued to the participants when
- 524 they have signed peering agreements and live up to the stated requirements. The server must reject
- 525 SSL/TLS clients that do not authenticate with a certificate issued under the Peppol root.

526 **4.3 ManageServiceMetadata service - binding**

- 527 Service Metadata Publishers use this interface to create or update metadata such as the endpoint
- address for retrieval of metadata about specific participant services.
- 529 The ManageServiceMetadata service is provided in the form of a SOAP-based Web service.

530 4.3.1 Transport binding

- The ManageServiceMetadata interface is bound to an HTTP SOAP 1.1 transport.
- See a WSDL for this in "Appendix B: WSDLs".

533 **4.3.2 Security**

- The service is secured at the transport level with a two-way SSL connection. The requestor must
- authenticate using a client certificate issued for use in the infrastructure by a trusted third-party.

5 DNS Spoof Mitigation

- The regular lookup of the address of the SMP for a given participant ID is performed using a standard
- 538 DNS lookup. There is a potential vulnerability of this process if there exists at least one "rogue"
- 539 certificate (e.g. stolen or otherwise illegally obtained).
- In this vulnerability, someone possessing such a rogue certificate could perform a DNS poisoning or a
- man-in-the-middle attack to fool senders of documents into making a lookup for a specific identifier
- in a malicious SMP (that uses the rogue certificate), effectively routing all messages intended for one
- or more recipients to a malicious access point. This attack could be used for disrupting message flow
- for those recipients, or for gaining access to confidential information in these messages (if the
- messages were not separately encrypted).
- One mitigation for this kind of attack on the DNS lookup process is to use DNSSEC rather than plain
- DNS. DNSSEC allow the authenticity of the DNS resolutions to be checked by means of a trust anchor
- in the domain chain. Therefore, it is recommended that an SML instance uses the DNSSEC
- 549 infrastructure.

6 Appendix A: XML Schema (non-normative)

This section defines the XML Schema types used in the interfaces. The normative version of the file is published together with this specification.

6.1 peppol-sml-types-v1.xsd
