Revision History

Version	Date	Description of changes	Author		
1.0.0	2010-02-15	First version (pending EC approval) Mikkel Hippe Brun, NITA			
1.0.1	2010-10-01	EC approved	Klaus Vilstrup Pedersen, DIFI		
1.1.0	2012-08-15	Make room for alternative Transport Protocols e.g. AS2	Klaus Vilstrup Pedersen, DIFI		
1.2.0	2021-02-24	Updated the references Improved layout	Philip Helger, OpenPeppol OO		
		Explicitly allowing Content-Type "application/xml" as it is equivalent to "text/xml" (chapter 5.1)			
		Removing the requirement that the encoding attribute value is case sensitive (chapter 5.2)			
		Change "is not" to "MUST NOT" in chapter 5.5			
		Replaced the references to the BusDox Common Definition document (BDEN-CEDF)			
		Added clarifications on ServiceActivationDate and ServiceExpirationDate			
		Linking peppol-smp-types-v1.xsd in the Appendix			
		Fixed a typo in the name of the transformation			
		Changed the Canonicalization Algorithm from "Exclusive" to "Inclusive"			
1.3.0	2023-06-05	Replace all occurrences of SHA-1 with SHA-256	Philip Helger, OpenPeppol OO

1 Introduction

2 1.1 Objective

1

8

12 13

14

21

- 3 This document describes the REST (Representational State Transfer) interface for Service Metadata
- 4 Publication within the Business Document Exchange Network (BUSDOX). It describes the
- 5 request/response exchanges between a Service Metadata Publisher and a client wishing to discover
- 6 endpoint information. A client could be an end-user business application or an Access Point. It also
- 7 defines the request processing that must happen at the client.

1.2 Scope

- 9 This specification relates to the Technical Transport Layer i.e. BusDox specifications. The BusDox
- specifications can be used in many interoperability settings. In the Peppol context, it provides
- transport for procurement documents as specified in the Peppol Profiles.

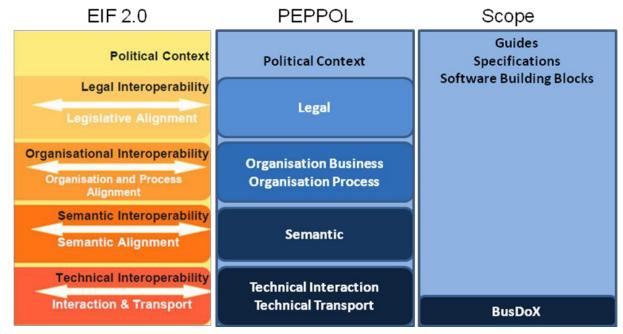

Fig. 1: Peppol Interoperability

1.3 Goals and non-goals

- 15 The goal of this document is to define the REST lookup interface that Service Metadata Publishers
- 16 ("SMP") and clients must support. Decisions regarding physical data format and management
- interfaces are left to implementers of such a service.
- 18 Service Metadata Publishers may be subject to additional constraints of agreements and governance
- 19 frameworks within instances of the BUSDOX infrastructure not covered in this specification, which
- 20 only addresses the technical interface of such a service.

1.4 Terminology

- The keywords "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD
- 23 NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as
- 24 described in RFC 2119 [RFC2119].

1.4.1 Notational conventions

25

42

Pseudo-schemas are provided for each component, before the description of the component. They use BNF-style conventions for attributes and elements: "?" denotes optionality (i.e. zero or one occurrences), "*" denotes zero or more occurrences, "+" one or more occurrences, "[" and "]" are used to form groups, and "|" represents choice. Attributes are conventionally assigned a value which corresponds to their type, as defined in the normative schema. Elements with simple content are conventionally assigned a value which corresponds to the type of their content, as defined in the normative schema. Pseudo schemas do not include extension points for brevity.

```
33
     <!-- sample pseudo-schema -->
34
     <defined element
35
         required attribute of type string="xs:string"
         optional attribute_of_type_int="xs:int"? >
36
37
       <required element />
38
       <optional element />?
39
       <one or more of these elements />+
40
       [ <choice 1 /> | <choice 2 /> ]*
     </defined element>
41
```

2 The Service Discovery Process

- The interfaces of the Service Metadata Locator (SML) service and the Service Metadata Publisher
- 69 (SMP) service cover both sender-side lookup and metadata management performed by SMPs.
- 70 Business Document Exchange Network (BUSDOX) mandates the following interfaces for these
- 71 services:

67

72

73 74

75

76

78

88 89

90

91

92

93

- Service Metadata Locator:
 - o DNS-based resolve mechanism to locate individual SMPs
 - Management interface towards SMPs
- Service Metadata Publishers:
 - Discovery interface towards senders
- 77 This specification only covers the discovery interface for Service Metadata Publication services.

2.1 Discovery flow

- 79 For a sender, the first step in the Discovery process is to establish the location of the Service
- 80 Metadata relating to the particular Participant Identifier to which the sender wants to transmit a
- 81 message. Each participant identifier is registered with one and only one Service Metadata Publisher.
- The sender looks up the endpoint for the Service Metadata Publisher using the DNS-based Service
- 83 Metadata Locator service (this is a regular DNS resolve). The sender can then retrieve the metadata
- 84 associated with the Participant Identifier. This metadata includes the information necessary to
- 85 transmit the message to the recipient endpoint.
- 86 The diagram below represents the lookup flow for a sender contacting both the Service Metadata
- 87 Locator and the SMP.

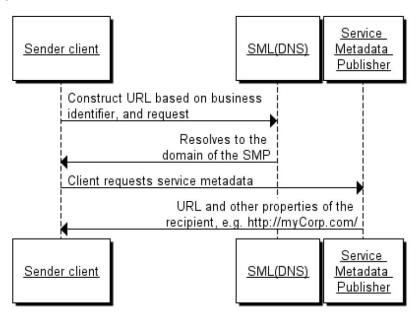

Fig. 2: Endpoint lookup with Service Metadata

Note: For optimization reasons, the discovery doesn't have to be performed for every transfer if the necessary information for transfer is already cached from previous transmissions. Though necessary exception handling has to be in place i.e. new lookup has to be performed if the sending shows that information is outdated e.g. old endpoint address.

118

2.1.1 Discovering services associated with a Participant Identifier

95 In addition to the direct lookup of Service Metadata based on participant identifier and document 96 type, a sender may want to discover what document types can be handled by a specific participant 97 identifier. Such discovery is relevant for applications supporting several equivalent business 98 processes. Knowing the capabilities of the recipient is valuable information to a sender application

and ultimately to an end user. E.g. the end user may be presented with a choice between a "simple" and a "rich" business process.

This is enabled by a pattern where the sender first retrieves the *ServiceGroup* entity, which holds a list of references to the *ServiceMetadata* resources associated with it. The *SignedServiceMetadata* in turn holds the metadata information that describes the capabilities associated with the recipient participant identifier

2.2 Service Metadata Publisher Redirection

For each participant identifier, the SML may only point to a single SMP. There are cases however where the owner of a participant identifier may want to use different SMPs for different document types or processes. This is supported by Service Metadata Publisher Redirection.

In this pattern, the sender is redirected by the SMP to a secondary, remote SMP where the actual *SignedServiceMetadata* can be found. A special element within the *SignedServiceMetadata* record of the SMP points to the SMP that has the actual Service Metadata and certificate information for that SMP. The diagram below shows this flow:

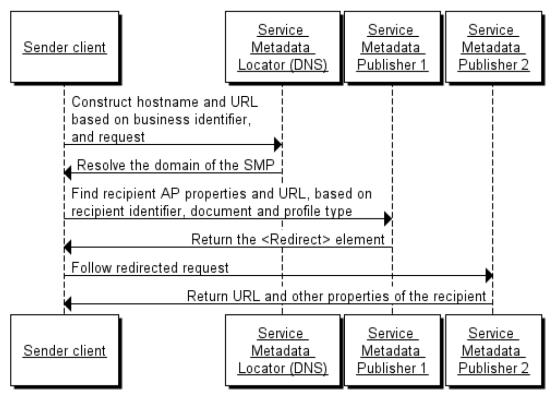

Fig. 3: Service Metadata Redirection

Note that only one degree of redirect is allowed; clients are not required to follow more than one redirect, i.e. a redirect resource cannot point to another redirect resource. Allowing one level of redirect permits the described use case to be realized, while avoiding the possibility of cyclic references and long chains of redirects

3 Interface model

- 120 This specification defines a REST-based interface for retrieving Service Metadata, but does not
- 121 specify interfaces for creating, updating, deleting and managing Service Metadata, or any internal
- data storage formats.
- 123 The goal is to allow the interface in this specification to expose data from many different Service
- Metadata back-ends, which may be based on any suitable technology such as for example RDBMS,
- 125 LDAP, or UDDI.

119

- Note that when adding or deleting Participant Identifiers in the SMP, an implementation of the SMP
- 127 will need to reflect its custody of a Participant Identifier in the SML. Please see the SML specification
- 128 [BDEN-SML] for a description of the processes and interfaces for doing this.

4 Data model

- This section outlines the data model of the interface. The data model comprises the following main data types:
- ServiceGroup

129

- ServiceMetadata / SignedServiceMetadata
- 134 Supporting data types for these main types are:
- ServiceInformation
- ServiceEndpointList
- ParticipantIdentifier
- 138 DocumentIdentifier
- 139 Redirect
- Process
- ProcessList
- Endpoint
- 143 Each of these data types is described in detail in the following sections.

4.1 On extension points

- 145 For each major entity, extension points have been added with the optional <smp:Extension>
- 146 element.

144

150 151

152153

154

155

156

147 4.1.1 Semantics and use

- 148 Child elements of the <smp:Extension> element are known as "custom extension elements".
- 149 Extension points may be used for optional extensions of service metadata. This implies:
 - Extension elements added to a specific Service Metadata resource MUST be ignorable by any
 client of the transport infrastructure. The ability to parse and adjust client behaviour based
 on an extension element MUST NOT be a prerequisite for a client to locate a service, or to
 make a successful request at the referenced service.
 - A client MAY ignore any extension element added to specific service metadata resource instances.

4.2 ServiceGroup

- 157 The ServiceGroup structure represents a set of services associated with a specific participant
- identifier that is handled by a specific SMP. The ServiceGroup structure holds a list of references to
- 159 *SignedServiceMetadata* resources in the *ServiceList* structure.
- 160 Pseudo-schema for ServiceGroup:

```
161
      <smp:ServiceGroup>
162
        <ids:ParticipantIdentifier scheme="xs:string">
163
          xs:string
164
        </ids:ParticipantIdentifier>
165
        <smp:ServiceMetadataReferenceCollection>
166
          <smp:ServiceMetadataReference href="xs:anyURI" />*
167
        </smp:ServiceMetadataReferenceCollection>
168
        <smp:Extension>xs:any</smp:Extension>?
169
      </smp:ServiceGroup>
```

170 Description of the individual fields (elements and attributes).

Field	Description			
ServiceGroup	Document element			
ParticipantIdentifier	Represents the business level endpoint key and key type, e.g. a DUNS or GLN number that is associated with a group of services. See [PFUOI4] for information on this data type.			
ServiceMetadataReferenceCollection	This structure holds a list of references to SignedServiceMetadata structures. From this list, a sender can follow the references to get each SignedServiceMetadata structure.			
ServiceMetadataReference (0*)	Contains the URL to a specific SignedServiceMetadata instance - see the REST binding section for details on the URL format. Note that references MUST refer to SignedServiceMetadata records that are signed by the certificate of the SMP. It MUST NOT point to SignedServiceMetadata resources published by external SMPs.			
Extension	The extension element may contain any XML element. Clients MAY ignore this element. It can be used to add extended metadata to individual references to Service Metadata resources.			

4.2.1 Non-normative example

171

194

Non-normative example of a *ServiceGroup* resource:

```
<?xml version="1.0" encoding="utf-8" ?>
173
174
      <!--
175
      This sample assumes that the service metadata publisher resides at
      "http://serviceMetadata.eu/".
176
      It assumes that the business identifier is "0010:5798000000001".
177
178
      -->
179
      <ServiceGroup xmlns="http://busdox.org/serviceMetadata/publishing/1.0/"</pre>
180
      xmlns:ids="http://busdox.org/transport/identifiers/1.0/">
        <ids:ParticipantIdentifier scheme="busdox-actorid-upis">
181
182
          0010:5798000000001
183
        </ids:ParticipantIdentifier>
184
        <ServiceMetadataReferenceCollection>
185
          <ServiceMetadataReference href="http://serviceMetadata.eu/busdox-actorid-</pre>
186
      upis%3A%3A0010%3A5798000000001/services/busdox-docid-
187
      qns%3A%3Aurn%3Aoasis%3Anames%3Aspecification%3Aubl%3Aschema%3Axsd%3AInvoice-
      2%3A%3AInvoice%23%23UBL-2.0"/>
188
189
        </ServiceMetadataReferenceCollection>
190
        <Extension>
191
          <ex:Test xmlns:ex="http://test.eu">Test</ex:Test>
192
        </Extension>
193
      </ServiceGroup>
```

4.3 ServiceMetadata

195 This data structure represents Metadata about a specific electronic service. The role of the

196 ServiceMetadata structure is to associate a participant identifier with the ability to receive a specific

- document type over a specific transport. It also describes which business processes a document can participate in, and various operational data such as service activation and expiration times.
- The *ServiceMetadata* resource contains all the metadata about a service that a sender Access Point needs to know in order to send a message to that service.
- 201 For recipients that want to associate more than one SMP with their participant identifier, they may
- redirect senders to an alternative SMP for specific document types. To achieve this, the
- 203 ServiceMetadata element defines the optional element Redirect. This element holds the URL of
- the alternative SMP, as well as the Subject Unique Identifier of the destination SMPs certificate used
- to sign its resources.

214

248

- 206 In the case where a client encounters such a redirection element, the client MUST follow the first
- 207 redirect reference to the alternative SMP. If the SignedServiceMetadata resource at the alternative
- 208 SMP also contains a redirection element, the client SHOULD NOT follow that redirect. It is the
- responsibility of the client to enforce this constraint.
- 210 Pseudo-schema for this data type:

Pseudo-schema for the ServiceInformation data type:

```
215
      <smp:ServiceInformation>
216
        <ids:ParticipantIdentifier scheme="xs:string">xs:string
217
        </ids:ParticipantIdentifier>
218
        <ids:DocumentIdentifier scheme="xs:string" />
219
        <smp:ProcessList>
220
          <smp:Process>+
221
            <ids:ProcessIdentifier scheme="xs:string" />
222
            <smp:ServiceEndpointList>
223
              <smp:Endpoint transportProfile="xs:string">+
224
                <wsa:EndpointReference />
225
                <smp:RequireBusinessLevelSignature>xs:boolean
226
                </smp:RequireBusinessLevelSignature>
227
                <smp:MinimumAuthenticationLevel>xs:string
228
                </smp:MinimumAuthenticationLevel >?
229
                <smp:ServiceActivationDate>xs:dateTime
230
                </smp:ServiceActivationDate>?
                <smp:ServiceExpirationDate>xs:dateTime
231
232
                </smp:ServiceExpirationDate>?
233
                <smp:Certificate>xs:string</smp:Certificate>
234
                <smp:ServiceDescription>xs:string
235
                </smp:ServiceDescription>
236
                <smp:TechnicalContactUrl>xs:anyURI
237
                </smp:TechnicalContactUrl>
238
                <smp:TechnicalInformationUrl>xs:anyURI
239
                </smp:TechnicalInformationUrl>?
240
                <smp:Extension>xs:any</smp:Extension>?
241
              </smp:Endpoint>
242
            </smp:ServiceEndpointList>
243
            <smp:Extension>xs:any</smp:Extension>?
244
          </smp:Process>
245
        </smp:ProcessList>
246
        <smp:Extension>xs:any</smp:Extension>?
247
      </smp:ServiceInformation>
```

Pseudo-schema for the Redirect data type:

Peppol Implementation Specification

- The Extension element may contain any XML element. Clients MAY ignore this element. It can be used to add extension metadata to the service metadata.
- The href attribute of the Redirect element contains the full address of the destination SMP record that the client is redirected to.
- 257 For example, assume that an SMP called "SMP1" has the address http://smp1.eu, and another
- SMP called "SMP2" has the address http://smp2.eu, and a client requests a resource with the
- 259 following URL (note that these examples have been percent encoded):
- http://smp1.eu/busdox-actoridupis%3A%3A0010%3A579800000001/services/busdox-docidqns%3A%3Aurn%3Aoasis%3Anames%3Aspecification%3Aubl%3Aschema%3Axsd%3AInvoice - 2%3A%3AInvoice%23%23UBL-2.0
- We now assume that the owner of these metadata has moved them to SMP2. SMP1 would then return a *SignedServiceMetadata* resource with a Redirect child element that has the href attribute set to
- http://smp2.eu/busdox-actoridupis%3A%3A0010%3A579800000001/services/busdox-docidqns%3A%3Aurn%3Aoasis%3Anames%3Aspecification%3Aubl%3Aschema%3Axsd%3AInvoice - 2%3A%3AInvoice%23%23UBL-2.0
- For the list of endpoints under each Endpoint element in the ServiceEndpointList, each endpoint MUST have different values of the transportProfile attribute, i.e. represent bindings to different transports.
- 274 Description of the individual fields (elements and attributes).

Field	Description				
/ServiceMetadata	Document element				
ServiceMetadata/Redirect	The direct child element of ServiceMetadata is either the Redirect element or the ServiceInformation element. The Redirect element indicates that a client must follow the URL of the href attribute of this element.				
Redirect/CertificateUID	Holds the Subject Unique Identifier of the certificate of the destination SMP. A client SHOULD validate that the Subject Unique Identifier of the certificate used to sign the resource at the destination SMP matches the Subject Unique Identifier published in the redirecting SMP.				
Redirect/Extension	The Extension element may contain any XML element. Clients MAY ignore this element. It can be used to add extension metadata to the Redirect.				
ServiceMetadata/ServiceInformation	The direct child element of ServiceMetadata is either the Redirect element or the				

Field	Description
	ServiceInformation element. The ServiceInformation element contains service information for an actual service registration, rather than a redirect to another SMP.
ServiceInformation/ParticipantIdentifier	The participant identifier. Comprises the identifier, and an identifier scheme. This identifier MUST have the same value of the {id} part of the URI of the enclosing ServiceMetadata resource. See the ParticipantIdentifier section of the 'Policy for use of identifiers' document [PFUOI4] for information on this data type.
ServiceInformation/DocumentIdentifier	Represents the type of document that the recipient is able to handle. The document type is represented by an identifier (identifying the document type) and an identifier scheme, which the format of the identifier itself. See the DocumentTypeIdentifier section of the 'Policy for use of identifiers' document [PFUOI4] for information on this data type.
ServiceInformation/ProcessList	Represents the processes that a specific document type can participate in, and endpoint address and binding information. Each process element describes a specific business process that accepts this type of document as input and holds a list of endpoint addresses (in the case that the service supports multiple transports) of services that implement the business process, plus information about the transport used for each endpoint. See the Process section of the 'Policy for use of identifiers' document [PFUOI4] for information on the identifier format.
Process/ProcessIdentifier	The identifier of the process. See the 'Policy for use of identifiers' document for a definition of process identifiers [PFUOI4]
Process/ServiceEndpointList	List of one or more endpoints that support this process.
ServiceEndpointList/Endpoint	Endpoint represents the technical endpoint and address type of the recipient, as an URL.
Endpoint/EndpointReference	The address of an endpoint, as a WS-Addressing Endpoint Reference (EPR).
Endpoint/@transportProfile	Indicates the type of transport protocol that is being used between access points, e.g. the Peppol AS4 profile (peppol-transport-as4-v2_0). A list of

Field	Description
	valid transport protocols is referenced from the 'Policy for use of identifiers' document [PFUOI4].
Endpoint/RequireBusinessLevelSignature	Set to true if the recipient requires business-level signatures for the message, meaning a signature applied to the business message before the message is put on the transport. This is independent of the transport-level signatures that a specific transport profile, such as the Peppol AS4 profile, might mandate. This flag does not indicate which type of business-level signature might be required. Setting or consuming business-level signatures would typically be the responsibility of the final senders and receivers of messages, rather than a set of APs.
Endpoint/MinimumAuthenticationLevel	Indicates the minimum authentication level that recipient requires. The specific semantics of this field is defined in a specific instance of the BUSDOX infrastructure.
	It could for example reflect the value of the "urn:eu:busdox:attribute:assurance-level" SAML attribute defined in the START specification.
Endpoint/ServiceActivationDate	Activation date of the service. Senders MUST ignore services that are not yet activated.
	A missing activation date MUST be interpreted as "valid since forever".
	Format of ServiceActivationDate is xs:dateTime.
Endpoint/ServiceExpirationDate	Expiration date of the service. Senders MUST ignore services that are expired.
	A missing expiration date MUST be interpreted as "valid until eternity".
	Format of ServiceExpirationDate is xs:dateTime.
Endpoint/Certificate	Holds the complete signing certificate of the recipient AP, as a PEM (base 64) encoded X509 DER formatted value.
Endpoint/ServiceDescription	A human readable description of the service.
Endpoint/TechnicalContactUrl	Represents a link to human readable contact information. This might also be an email address.
Endpoint/TechnicalInformationUrl	A URL to human readable documentation of the service format. This could for example be a web site

Field	Description
	containing links to XML Schemas, WSDLs, Schematrons and other relevant resources.
Process/Extension	The Extension element may contain any XML element. Clients MAY ignore this element. It can be used to add extension metadata to the process metadata block as a whole.
ServiceInformation/Extension	The Extension element may contain any XML element. Clients MAY ignore this element. It can be used to add extension metadata to the service metadata.

275 4.3.1 Non-normative example

For a non-normative example of a *ServiceMetadata* resource, see the *SignedServiceMetadata* non-

277 normative example below.

278

286

287

288

289

4.4 SignedServiceMetadata

The SignedServiceMetadata structure is a ServiceMetadata structure that has been signed by the SMP, according to governance policies that are not covered by this document. Pseudo-schema for this data type:

- ServiceMetadata is the ServiceMetadata element covered by the signature.
- Signature represents an enveloped XML signature over the SignedServiceMetadata element.

4.4.1 Non-normative example

290 Non-normative example of a *SignedServiceMetadata* resource.

5 Service Metadata Publishing REST binding

387 This section describes the REST binding of the SMP interface.

5.1 The use of HTTP

386

388

404

- A service implementing the REST binding MUST set the HTTP Content-Type header, and give it a value of text/xml or application/xml. A service implementing the REST profile MUST NOT use TLS (Transport Layer Security) or SSL (Secure Sockets Layer). An instance of the BUSDOX
- infrastructure MAY set restrictions on what ports are allowed.
- An implementation of the SMP might choose to manage resources through the HTTP POST, PUT and DELETE verbs. It is however up to each implementation to choose how to manage records, and use of HTTP POST, PUT and DELETE is not mandated or regulated by this specification.
- 396 HTTP GET operations MUST return the following HTTP status codes:

HTTP Status Code	Meaning
200	Must be returned if the resource is retrieved correctly.
404	Code 404 must be returned if a specific resource could not be found. This could for example be the result of a request containing a participant identifier that does not exist.
500	Code 500 must be returned if the service experiences an internal processing error.

- 397 The service MAY support other HTTP status codes as well.
- 398 The service SHOULD NOT use HTTP redirection in the manner indicated by the HTTP 3xx codes.
- 399 Clients are not required to support active redirection.

400 5.2 The use of XML and encoding

- 401 XML document returned by HTTP GET MUST be UTF-8 encoded. They MUST contain a document type
- 402 declaration starting with <?xml which includes the encoding attribute set to UTF-8. Please
- 403 observe that the content of the encoding attribute is not case sensitive. Version 1.0 of XML is used.

5.3 Resources and identifiers

405 The REST interface comprises 2 types of resources.

Resource	URI	Meth od	XML resource root element	HTT P Stat us	Description of returned content
ServiceGroup	/{identifier scheme}::{id}	GET	<servicegr oup></servicegr 	200; 500; 404	Holds the participant identifier of the recipient, and a list of references to individual ServiceMetadata resources that are associated with that participant identifier.

SignedServiceMet	/{identifier	GET	<signedse< th=""><th>200;</th><th>Holds all of the metadata</th></signedse<>	200;	Holds all of the metadata
adata	<pre>scheme}::{id}/ser vices/{docType}</pre>		rviceMeta data>	500; 404	about a Service, or a redirection URL to another
	See section below for {docType} format		uata>	404	Service Metadata Publisher holding this information.

Fig. 4: Table of resources and identifiers

A service implementing the REST binding MUST support these resource types. It MUST provide access to these using the URI scheme of table in Fig. 3.

5.3.1 On the use of percent encoding

406

407

408

409

- When any types of BUSDOX identifiers are used in URLs, each section between slashes MUST be
- 411 percent encoded according to [RFC3986] individually, i.e. section by section.
- 412 For example, this implies that for an URL in the form of / {identifier
- scheme)::{id}/services/{docType} the slash literals MUST NOT be URL encoded.

414 5.3.2 Using identifiers in the REST Resource URLs

- This section describes specifically how participant and document identifiers are used to reference
- 416 ServiceGroup and SignedServiceMetadata REST resources. For a general definition on how to
- represent participant and document identifiers in URLs, see [PFUOI4].
- For the URL referencing a ServiceGroup resource, the {identifier scheme}::{id} part
- 419 follows the participant identifier format described in the "ParticipantIdentifier" section of the 'Policy
- 420 for use of identifiers' document [PFUOI4].
- 421 The following URL format is used:

422 /{identifier scheme}::{id}

- 423 In the reference to the SignedServiceMetadata or Redirect resources
- 424 (/{id}/services/{docType}), the {docType} part consists of {document type
- identifier scheme}::{document type identifier}. For information on the format
- of {document type identifier}, see the DocumentIdentifier section of the 'Policy for use of
- 427 identifiers' document [PFUOI4].

428 5.3.3 Non-normative identifier example

- We assume an SMP can be accessed at the URL http://serviceMetadata.eu.
- 430 A business with the participant identifier 0010:579800000001 would have the following
- identifier for the *ServiceGroup* resource:
- http://serviceMetadata.eu/busdox-actorid-upis::0010:5798000000001
- 433 After percent encoding:
- 434 http://serviceMetadata.eu/busdox-actorid-upis%3a%3a0010%3a5798000000001
- In the case of a NES-UBL order, a *SignedServiceMetadata* or *Redirect* resource can then be identified by
 - Identifier format type: busdox-docid-qns
- Root namespace:

437

urn:oasis:names:specification:ubl:schema:xsd:Order-2

- Document element local name: Order
- Subtype identifier: UBL-2.0 (since several versions of the Order schema may use the same namespace + document element name)
- The document type identifier will then be:
- busdox-docid-qns::urn:oasis:names:specification:ubl:schema:xsd:Order-2::Order##UBL-2.0
- The document type identifier MUST be percent encoded as described in [RFC3986]. The above, non-
- 447 normative example is thus encoded to
- busdox-docidqns%3A%3Aurn%3Aoasis%3Anames%3Aspecification%3Aubl%3Aschema%3Axsd%3AOrder-2%3A%3AOrder%23%23UBL-2.0
- 451 The entire URL reference to a SignedServiceMetadata or Redirect resource thus has the form
- 452 {URL to server}/{identifier scheme}::{id}/services/{document identifier type}::{rootNamespace}::{documentElementLocalName}[##{Subtype identifier}]
- The percent-encoded form of the identifier using the above example will then be
- 455 http://serviceMetadata.eu/busdox-actorid-
- 456 upis%3a%3a0010%3a579800000001/services/busdox-docid-
- 457 qns%3A%3Aurn%3Aoasis%3Anames%3Aspecification%3Aubl%3Aschema%3Axsd%3AOrder-
- 458 2%3A%3AOrder%23%23UBL-2.0
- Note that the forward slashes delimiting the individual parts of the REST resource identifier URL are not percent encoded, since they are part of the URL.
- 461 5.3.4 Implementation considerations
- When a client is redirected to an SMP using the DNS-based SML scheme described in [BDEN-SML],
- 463 the HTTP Host header will be set to a value originating from the CNAME alias set in the SML
- 464 (http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.23). Implementations should be
- prepared to accept requests with this "host" header value.
- 466 5.4 Referencing the SMP REST binding
- 467 For referencing the SMP REST binding, for example from SML records, the following identifier should
- be used for the version 1.0 of the SMP REST binding:
- 469 http://busdox.org/serviceMetadata/publishing/1.0/
- 470 This is identical to the target namespace of the SMP schema.
- 471 **5.5 Security**
- 472 At the transport level, the service MUST NOT be secured.
- 473 **5.5.1 Message signature**
- The message returned by the service is signed by the Service Metadata Publisher with XML-Signature
- 475 according to [XML-DSIG].
- 476 The signature MUST be an enveloped XML signature represented via a ds:Signature element
- 477 embedded in the SignedServiceMetadata element. The ds:Signature element MUST be
- 478 constructed according to the following rules:

the destination SMP.

504

479 480 481 482 483 484 485 486 487 488 489	•	The <reference> MUST use exactly one <transform> being: http://www.w3.org/2000/09/xmldsig#enveloped-signature The <ds:keyinfo> element MUST contain an <ds:x509data> element with an <ds:x509certificate> sub-element containing the signer's X.509 certificate as PEM (base 64) encoded X509 DER value. The canonicalization algorithm MUST be http://www.w3.org/TR/2001/REC-xml-c14n-20010315 The SignatureMethod MUST be http://www.w3.org/2001/04/xmldsig-more#rsa-sha256 The DigestMethod MUST be http://www.w3.org/2001/04/xmlenc#sha256</ds:x509certificate></ds:x509data></ds:keyinfo></transform></reference>
490	5.5.2	Verifying the signature
491 492 493	When verifying the signature, the consumer has access to the full certificate as a PEM (base 64) encoded X509 DER value within the ds:Signature element. The consumer may verify the signature by	
494 495 496 497 498	a) b) c) d)	extracting the certificate from the ds:X509Data element, verify that it has been issued by the trusted root, perform a validation of the signature, and perform the required certificate validation steps (which might include checking expiration/activation dates and revocation lists).
499	5.5.3	Verifying the signature of the destination SMP
500 501 502 503	For the redirect scheme, the unique identifier of the destination SMP signing certificate is stored at the redirecting SMP. In addition to the regular signature validation performed by the client of the destination SMP resources, the client SHOULD also validate that the identifier of the destination SMP signing certificate corresponds to the unique identifier which the redirecting SMP claims belongs to
