16

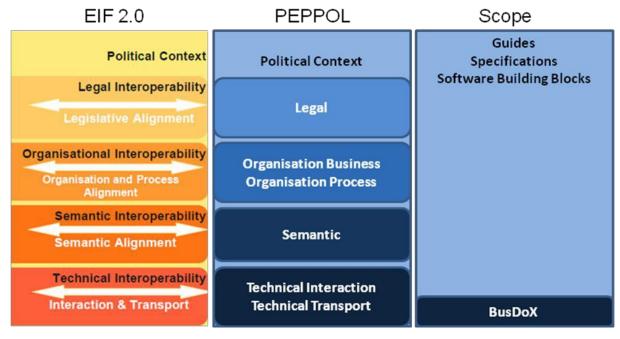

20

22

- 3 This document defines the profiles for the discovery and management interfaces for the Business
- 4 Document Exchange Network (BUSDOX) Service Metadata Locator service.
- 5 The Service Metadata Locator service exposes three interfaces:
 - Service Metadata discovery interface
 This is the lookup interface which enables senders to discover service metadata about specific target participants
 - Manage participant identifiers interface
 This is the interface for Service Metadata publishers for managing the metadata relating to specific participant identifiers that they make available.
 - Manage service metadata interface
 This is the interface for Service Metadata publishers for managing the metadata about their services, e.g. binding, interface profile and key information.
- 15 This document describes the physical bindings of the logical interfaces in section 3.1.

1.2 Scope

- 17 This specification relates to the Technical Transport Layer i.e. BusDox specifications. The BusDox
- specifications can be used in many interoperability settings. In the Peppol context, it provides
- transport for procurement documents as specified in the Peppol Profiles.

21 Fig. 1: Peppol Interoperability

1.3 Goals and non-goals

- 23 The goal of this document is to describe the interface and transport bindings of the Service Metadata
- 24 Locator (SML) service. It does not consider its implementation or internal data formats, user
- 25 management and other procedures related to the operation of this service.

1.4 Terminology

26

30

47

49

- 27 The keywords "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD
- 28 NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as
- 29 described in RFC 2119 [RFC2119].

1.4.1 Notational conventions

- 31 Pseudo-schemas are provided for each component, before the description of the component. They
- 32 use BNF-style conventions for attributes and elements: "?" denotes optionality (i.e. zero or one
- occurrences), "*" denotes zero or more occurrences, "+" one or more occurrences, "[" and "]" are
- used to form groups, and "|" represents choice. Attributes are conventionally assigned a value which
- 35 corresponds to their type, as defined in the normative schema. Elements with simple content are
- 36 conventionally assigned a value which corresponds to the type of their content, as defined in the
- 37 normative schema. Pseudo schemas do not include extension points for brevity.

```
38
     <!-- sample pseudo-schema -->
39
     <defined element
40
         required attribute of type string="xs:string"
41
         optional attribute of type int="xs:int"? >
42
       <required element />
43
       <optional element />?
44
       <one_or_more_of_these_elements />+
       [ <choice 1 /> | <choice 2 /> ]*
45
     </defined element>
46
```

2 The Service Discovery Process

- 76 The interfaces of the Service Metadata Locator (SML) service and the Service Metadata Publisher
- 77 (SMP) service cover both sender-side lookup and metadata management performed by SMPs.
- 78 BUSDOX mandates the following interfaces for these services:
 - Service Metadata Locator:

75

79

80

82

83

91

- Discovery interface for senders
- 81 o Management interface for SMPs
 - Service Metadata Publishers:
 - Discovery interface for senders
- This specification only covers the interfaces for the Service Metadata Locator.
- 85 The Service Metadata Locator service specification is based on the use of DNS (Domain Name
- 86 System) lookups to find the address of the Service Metadata for a given participant ID [DNS-1034]
- 87 [DNS-1035]. This approach has the advantage that it does not need a single central server to run the
- 88 Discovery interface, with its associated single point of failure. Instead, the already distributed and
- 89 highly redundant infrastructure which supports DNS is used. The SML service itself thus plays the role
- of providing controlled access to the creation and update of entries in the DNS.

2.1 Discovery flow

- 92 For a sender, the first step in the Discovery process is to establish the location of the Service
- 93 Metadata relating to the particular Participant Identifier to which the sender wants to transmit a
- 94 message. Each participant identifier is registered with one and only one Service Metadata Publisher.
- 95 The sender constructs the address for the service metadata for a given recipient participant identifier
- 96 using a standard format, as follows:
- 97 http://<hash over recipientID>.<schemeID>.<SML
- 98 | domain>/<recipientID>/services/<documentType>
- 99 The sender uses this URL in an HTTP GET operation which returns the metadata relating to that
- 100 recipient and the specific document type (for details, see the Service Metadata Publishing
- specification [BDEN-SMP]). The sender can obtain the information necessary to transmit a message
- 102 containing that document type to that recipient from the returned metadata. This sequence is shown
- 103 in Fig. 2.
- Note that the sender is required to know 2 pieces of information about the recipient the recipient's
- 105 participant ID and the ID of the Scheme of the participant ID (i.e. the format or type of the
- 106 participant ID). This provides for flexibility in the types of participant identifier that can be used in the
- 107 system. Since in general a participant ID may not have a format that is acceptable in an HTTP URL,
- the ID is hashed into a string as described in section 3.1.1 Format of Participant Identifiers.

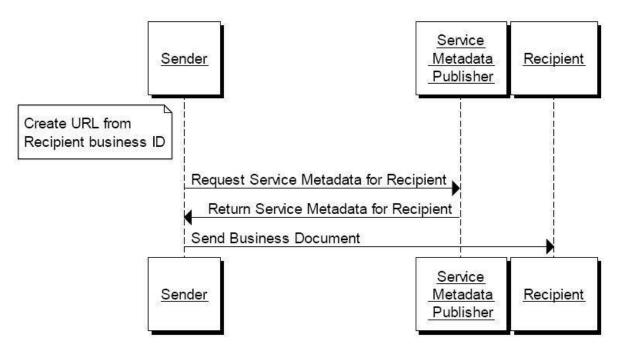

Fig. 2: Sequence Diagram for Sender transmitting Document to Recipient

The underlying design of the Discovery process is based on the use of Domain Name System (DNS) CNAME records which correspond to the Domain Name in the format given above, namely that there is a CNAME record for the domain name .<schemeID>.<sml domain>. Furthermore, that CNAME record points at the Service Metadata Publisher which holds the metadata about that recipient. This means that an address lookup for the domain name by the sender naturally resolves to the Service Metadata Publisher holding the metadata. The resolution of Web URLs in this way is a fundamental part of the World Wide Web and so it is based on standard technology that it available to all users.

2.2 Flows Relating to Service Metadata Publishers

The management of the DNS CNAME records for a given participant identifier is performed through the Management interface of the Service Metadata Locator. The management interface is primarily for use by the Service Metadata Publisher which controls the service metadata for a given participant identifier. Note that the DNS CNAME records are **not** manipulated directly by the Service Metadata Publisher, but are manipulated by the Service Metadata Locator service following requests made to its Management interface. The basic process steps for the SMP to manipulate the metadata relating to a given participant are shown in Fig. 3.

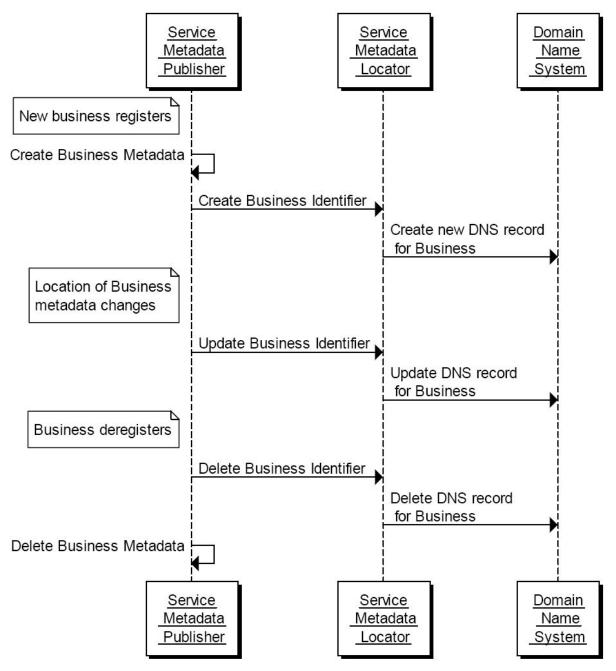

Fig. 3: Sequence Diagram for Service Metadata Publisher Adding, Updating and Removing Metadata for a Participant

Each Service Metadata Publisher is required to register the address of its server with the Service Metadata Locator. Only once this has been done can information relating to specific Participant Identifiers be presented to the SML. The address for the metadata for a given participant is tied to the address of the SMP with which the participant is registered. For this purpose, the SMP uses the ManageServiceMetadata interface with flows as shown in Fig. 4.

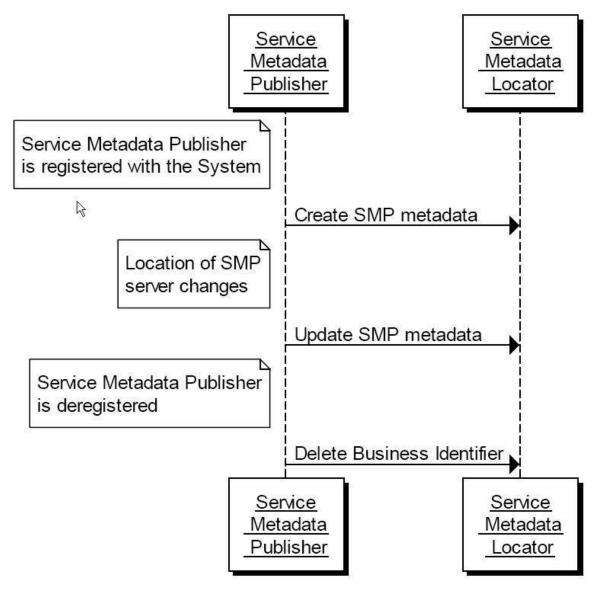

Fig. 4: Service Metadata Publisher use of the ManageServiceMetadata

Another set of steps relating to SMPs and the SML relates to the migration of the metadata about a participant from one SMP to another SMP (for example, the participant decides to change suppliers for this function). There are interfaces to the SML to support migrations of this kind, which imply following a sequence of steps along the lines shown in Fig. 5.

In this sequence, the original SMP receives a request from a participant to migrate its metadata to a new SMP (a step that is done out-of-band: there are no interfaces defined in these specifications for this). The original SMP generates a "Migration Key" and invokes the PrepareToMigrate operation of the SML and then passes the Migration Key to the new SMP (the key passing is an out-of-band step not defined in these specifications). When the new SMP has created the relevant metadata for the participant, it signals that it is taking over by invoking the Migrate operation of the SML, which then causes the DNS record(s) for that participant ID to be updated to point at the new SMP. Once this switch is complete, the original SMP can remove the metadata which it holds for the participant.

The following rules apply to the Migration Key

• MUST have at least 8 characters and not more than 24 characters

- MUST contain at least 2 lower case characters (a-z)
 - MUST contain at least 2 upper case characters (A-Z)
 - MUST contain at least 2 digits (0-9)

152

153

154

155

156157

158159

- MUST contain at least 2 characters from this set: "@" (ASCII code 64), "#" (35), "\$" (36), "%" (37), "(" (40), ")" (41), "[" (91), "]" (93), "{" (123), "}" (125), "*" (42), "^" (94), "-" (45), "!" (33), "~" (126), "|" (124), "+" (43) and "=" (61)
- MUST NOT contain whitespace characters

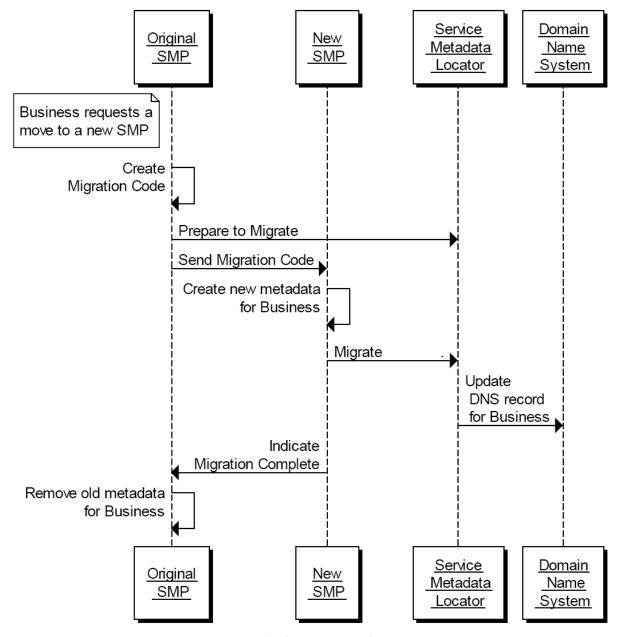

Fig. 5: Steps in Migrating Metadata for a Participant from one SMP to a new SMP

3 Interfaces and Data Model

161 This section outlines the service interfaces and the related data model.

3.1 Service Metadata Locator Service, logical interface

- 163 The Service Metadata Locator Service interface is divided into 2 logical parts:
- Manage participant identifiers interface
 This is the interface for Service Metadata Publishers for managing the registered participant identifiers they expose.
- Manage service metadata interface
 This is the interface for Service Metadata Publishers for managing the metadata about their metadata publishing service, e.g. binding, interface profile and key information.

170 3.1.1 Format of Participant Identifiers

- 171 BUSDOX functions by means of logical addresses for the metadata of services offered by a
- participant, of the form:

160

162

- 173 http://<hash over recipientID>.<schemeID>.<SML
 174 domain>/<recipientID>/services/<documentType>
- 175 BUSDOX is flexible with regard to the use of any one of a wide range of schemes for the format of
- participant identifiers, represented by the schemeID. However, when using this form of HTTP Web
- address, which is resolved through the DNS system, the format of the recipientID and the
- 178 schemeID is constrained by the requirements of the DNS system. This means that both the
- 179 recipientID and the schemeID must be strings which use the ASCII alphanumeric characters
- only and which have to start with an alphabetic character.
- BUSDOX allocates schemeIDs to conform to this requirement. However, there is no guarantee that
- the participant IDs will conform to this requirement for any given scheme (remembering that in
- many cases the participant ID scheme will be a pre-existing scheme with its own format rules that
- might violate the requirements of a DNS name). Therefore a hash of the participant ID is always used,
- using the MD5 hash algorithm [MD5], and prefixed by "B-".
- An example participant ID is 0010:579800000001, for which the MD5 hash is
- e49b223851f6e97cbfce4f72c3402aac. See POLICY 7 of the [PFUOI4] for details.

188 3.1.2 ManageParticipantIdentifier interface

- 189 The ManageParticipantIdentifier interface allows Service Metadata Publishers to manage the
- 190 information in the Service Metadata Locator Service relating to individual participant identifiers for
- which they hold metadata.
- 192 This interface requires authentication of the Service Metadata Publisher. The identity of the Service
- 193 Metadata Publisher derived from the authentication process identifies the Service Metadata
- 194 Publisher associated with the Participant Identifier(s) which are managed via this interface.
- 195 It is possible for a given Service Metadata Publisher to provide the metadata for all participant
- identifiers belonging to a particular participant identifier scheme. If this is the case, then it
- 197 corresponds to the concept of a "wildcard" CNAME record in the DNS, along the lines:
- 198 *.<schemeID>.<SML domain> CNAME <SMP domain>
- 199 <SMP domain> may either be the domain name associated with the SMP, or an alias for it.

- This implies that all participant identifiers for that schemeID will have addresses that resolve to the single address of that one SMP and that as result only one SMP can handle the metadata for all participant identifiers of that scheme. Wildcard records are indicated through the use of "*" as the participant identifier in the operations of the ManageParticipantIdentifier interface.
- The ManageParticipantIdentifier interface has the following operations:
- 205 Create
- 206 CreateList
- 207 Delete
- 208 DeleteList
- PrepareToMigrate
- 210 Migrate
- 211 List
- 212 **Create()**
- 213 Creates an entry in the Service Metadata Locator Service for information relating to a specific
- 214 participant identifier. Regardless of the number of services a recipient exposes, only one record
- 215 corresponding to the participant identifier is created in the Service Metadata Locator Service by the
- 216 Service Metadata Publisher which exposes the services for that participant.
- Input CreateParticipantIdentifier:
 ServiceMetadataPublisherServiceForParticipantType
 contains the Participant Identifier for a given participant and the identifier of the SMP which
 holds its data
- Fault: notFoundFault
- returned if the identifier of the SMP could not be found
- Fault: unauthorizedFault
- returned if the caller is not authorized to invoke the Create operation
- Fault: badRequestFault
- 226 returned if the supplied CreateParticipantIdentifier does not contain consistent
- 227 data
- Fault: internalErrorFault
- returned if the SML service is unable to process the request for any reason
- 230 CreateList()
- 231 Creates a set of entries in the Service Metadata Locator Service for information relating to a list of
- 232 participant identifiers. Regardless of the number of services a recipient exposes, only one record
- 233 corresponding to each participant identifier is created in the Service Metadata Locator Service by the
- 234 Service Metadata Publisher which exposes the services for that participant.
- Input CreateList: ParticipantIdentifierPage

 contains the list of Participant Identifiers for the participants which are added to the S
- contains the list of Participant Identifiers for the participants which are added to the Service

 Metadata Locator Service. The NextPageIdentifier element is absent.
- Fault: notFoundFault
- returned if the identifier of the SMP could not be found

240 241	•	Fault: unauthorizedFault returned if the caller is not authorized to invoke the CreateList operation
242 243	•	Fault: badRequestFault returned if the supplied CreateList does not contain consistent data
244 245	•	Fault: internalErrorFault returned if the SML service is unable to process the request for any reason
246	Delete	0
247	Delete	s the information that the SML Service holds for a specific Participant Identifier.
248 249 250 251	•	Input DeleteParticipantIdentifier: ServiceMetadataPublisherServiceForParticipantType contains the Participant Identifier for a given participant and the identifier of the SMP that publishes its metadata
252 253	•	Fault: notFoundFault returned if the participant identifier or the identifier of the SMP could not be found
254 255	•	Fault: unauthorizedFault returned if the caller is not authorized to invoke the Delete operation
256 257 258	•	Fault: badRequestFault returned if the supplied DeleteParticipantIdentifier does not contain consistent data
259 260	•	Fault: internalErrorFault returned if the SML service is unable to process the request for any reason
261	Delete	List()
262	Delete	s the information that the SML Service holds for a list of Participant Identifiers.
263264265	•	Input DeleteList: ParticipantIdentifier contains the list of Participant Identifiers for the participants which are removed from the Service Metadata Locator Service. The NextPageIdentifier element is absent.
266 267	•	Fault: notFoundFault returned if one or more participant identifiers or the identifier of the SMP could not be found
268 269	•	Fault: unauthorizedFault returned if the caller is not authorized to invoke the DeleteList operation
270 271	•	Fault: badRequestFault returned if the supplied DeleteList does not contain consistent data
272 273	•	Fault: internalErrorFault returned if the SML service is unable to process the request for any reason
274	Prepar	eToMigrate()
275	Prepar	es a Participant Identifier for migration to a new Service Metadata Publisher. This operation is

276 called by the Service Metadata Publisher which currently publishes the metadata for the Participant Identifier. The Service Metadata Publisher supplies a Migration Code which is used to control the 277 278 migration process. The Migration Code must be passed (out of band) to the Service Metadata 279 Publisher which is taking over the publishing of the metadata for the Participant Identifier and which MUST be used on the invocation of the Migrate () operation.

- This operation can only be invoked by the Service Metadata Publisher which currently publishes the metadata for the specified Participant Identifier.
- Input PrepareMigrationRecord: MigrationRecordType
 284 contains the Migration Key and the Participant Identifier which is about to be migrated from
 285 one Service Metadata Publisher to another.
- Fault: notFoundFault
 returned if the participant identifier or the identifier of the SMP could not be found
- Fault: unauthorizedFault
 returned if the caller is not authorized to invoke the PrepareToMigrate operation
- Fault: badRequestFault
 returned if the supplied PrepateMigrationRecord does not contain consistent data
- Fault: internalErrorFault
 returned if the SML service is unable to process the request for any reason

294 Migrate()

- 295 Migrates a Participant Identifier already held by the Service Metadata Locator Service to target a new
- 296 Service Metadata Publisher. This operation is called by the Service Metadata Publisher which is
- taking over the publishing for the Participant Identifier. The operation requires the new Service
- 298 Metadata Publisher to provide a migration code which was originally obtained from the old Service
- 299 Metadata Publisher.
- The PrepareToMigrate () operation MUST have been previously invoked for the supplied
- Participant Identifier, using the same MigrationCode, otherwise the Migrate () operation fails.
- 302 Following the successful invocation of this operation, the lookup of the metadata for the service
- 303 endpoints relating to a particular Participant Identifier will resolve (via DNS) to the new Service
- 304 Metadata Publisher.
 - Input CompleteMigrationRecord: MigrationRecordType contains the Migration Key and the Participant Identifier which is to be migrated from one Service Metadata Publisher to another.
- Fault: notFoundFault
 returned if the migration key or the identifier of the SMP could not be found
- Fault: unauthorizedFault
 returned if the caller is not authorized to invoke the Migrate operation
- Fault: badRequestFault
 returned if the supplied CompleteMigrationRecord does not contain consistent data
- Fault: internalErrorFault
 returned if the SML service is unable to process the request for any reason

316 **List()**

305

306

- 317 List() is used to retrieve a list of all participant identifiers associated with a single Service
- 318 Metadata Publisher, for synchronization purposes. Since this list may be large, it is returned as pages
- of data, with each page being linked from the previous page.
- Input Page: PageRequest
- 321 contains a PageRequest containing the ServiceMetadataPublisherID of the SMP

323	NextPageIdentifier is absent, the first page is returned.
324 325 326 327	 Output: ParticipantIdentifierPage a page of Participant Identifier entries associated with the Service Metadata Publisher, also containing a <page></page> element containing the identifier that represents the next page, if any.
328 329	 Fault: notFoundFault returned if the next page or the identifier of the SMP could not be found
330 331	 Fault: unauthorizedFault returned if the caller is not authorized to invoke the List operation
332 333	 Fault: badRequestFault returned if the supplied NextPage does not contain consistent data
334 335	 Fault: internalErrorFault returned if the SML service is unable to process the request for any reason
336 337 338	Note that the underlying data may be updated between one invocation of $\texttt{List}()$ and a subsequent invocation of $\texttt{List}()$, so that a set of retrieved pages of participant identifiers may not represent a consistent set of data.
339	3.1.3 ManageServiceMetadata interface
340 341 342	The ManageServiceMetadata interface allows Service Metadata Publishers to manage the metadata held in the Service Metadata Locator Service about their service metadata publisher services, e.g. binding, interface profile and key information.
343 344 345	This interface requires authentication of the user. The identity of the user derived from the authentication process identifies the Service Metadata Publisher associated with the service metadata which is managed via this interface.
346	The ManageServiceMetadata interface has the following operations:
347	• Create
348	Read
349	Update
350	• Delete
351	Create()
352 353 354	Establishes a Service Metadata Publisher metadata record, containing the metadata about the Service Metadata Publisher, as outlined in the ServiceMetadataPublisherService data type.
355 356 357 358 359	 Input CreateServiceMetadataPublisherService: ServiceMetadataPublisherService contains the service metadata publisher information, which includes the logical and physical addresses for the SMP (Domain name and IP address). It is assumed that the ServiceMetadataPublisherID has been assigned to the calling user out-of-bands.
360 361	 Fault: unauthorizedFault returned if the caller is not authorized to invoke the Create operation

362 363 364	•	Fault: badRequestFault returned if the supplied CreateServiceMetadataPublisherService does not contain consistent data
365 366	•	Fault: internalErrorFault returned if the SML service is unable to process the request for any reason
367	Read()	
368	Retriev	es the Service Metadata Publisher record for the Service Metadata Publisher.
369 370 371	•	Input ReadServiceMetadataPublisherService: ServiceMetadataPublisherID the unique ID of the Service Metadata Publisher for which the record is required
372 373 374	•	Output: ServiceMetadataPublisherService the service metadata publisher record, in the form of a ServiceMetadataPublisherService data type
375 376	•	Fault: notFoundFault returned if the identifier of the SMP could not be found
377 378	•	Fault: unauthorizedFault returned if the caller is not authorized to invoke the Read operation
379 380	•	Fault: badRequestFault returned if the supplied parameter does not contain consistent data
381 382	•	Fault: internalErrorFault returned if the SML service is unable to process the request for any reason
383	Update	0
384	Update	s the Service Metadata Publisher record for the Service Metadata Publisher
385 386 387 388	•	Input UpdateServiceMetadataPublisheServicer: ServiceMetadataPublisherService contains the service metadata for the service metadata publisher, which includes the logical and physical addresses for the SMP (Domain name and IP address)
389 390	•	Fault: notFoundFault returned if the identifier of the SMP could not be found
391 392	•	Fault: unauthorizedFault returned if the caller is not authorized to invoke the Update operation
393 394 395	•	Fault: badRequestFault returned if the supplied UpdateServiceMetadataPublisheServicer does not contain consistent data
396 397	•	Fault: internalErrorFault returned if the SML service is unable to process the request for any reason
398	Delete()
399	Deletes	the Service Metadata Publisher record for the Service Metadata Publisher
400 401 402	•	<pre>Input DeleteServiceMetadataPublisherService: ServiceMetadataPublisherID the unique ID of the Service Metadata Publisher to delete</pre>

403 • Fault: notFoundFault 404

returned if the identifier of the SMP could not be found

405 • Fault: unauthorizedFault

returned if the caller is not authorized to invoke the <code>Delete</code> operation

407 • Fault: badRequestFault

returned if the supplied DeleteServiceMetadataPublisherService does not

contain consistent data

410 • Fault: internalErrorFault

returned if the SML service is unable to process the request for any reason

412 3.1.4 Fault Descriptions

SMP Not Found Fault 413

406

408

409

411

[action]	http://busdox.org/2010/02/locator/fault
Code	Sender
Subcode	notFoundFault
Reason	The identifier of the SMP supplied could not be found by the SML
Detail	As detailed by the SML

414 **Unauthorized Fault**

[action]	http://busdox.org/2010/02/locator/fault
Code	Sender
Subcode	unauthorizedFault
Reason	The caller is not authorized to perform the operation requested
Detail	As detailed by the SML

415 **Bad Request Fault**

[action]	http://busdox.org/2010/02/locator/fault
Code	Sender
Subcode	badRequestFault
Reason	The operation request was incorrect in some way
Detail	As detailed by the SML

416 **Internal Error Fault**

[action]	http://busdox.org/2010/02/locator/fault
Code	Sender
Subcode	internalErrorFault
Reason	The SML encountered an error while processing the request
Detail	As detailed by the SML

3.2 Service Metadata Locator - data model

- 418 The data model for the Service Metadata Locator involves the following data types:
- ServiceMetadataPublisher
- RecipientParticipantIdentifier
- ParticipantIdentifierPage
- 422 MigrationRecord

417

433

434

435

436

437 438

423 Each of these data types is described in detail in the following subsections.

424 3.2.1 ServiceMetadataPublisherService datatype

425 Represents a Metadata Publisher Service.

- 432 ServiceMetadataPublisherService has the following sub-elements:
 - PublisherEndpoint (1..1): PublisherEndpointType
 the technical endpoint address of the Service Metadata Publisher, which can be used to
 query information about particular participant identifiers. ServiceEndpointList is a type
 defined in the ServiceMetadataPublishingTypes Schema. The PublisherEndpoint
 element may be a domain name or an IP address of the SMP, or a wildcard expression based
 on the domain name.
- ServiceMetadataPublisherID (1..1): xs:string
 holds the Unique Identifier of the SMP. When creating a
 ServiceMetadataPublisherService record, it is assumed that the publisher ID has
 been obtained out of band.

443 3.2.2 ServiceMetadataPublisherServiceForParticipant datatype

Represents a Metadata Publisher Service containing information about a particular Participant Identifier.

- 450 ServiceMetadataPublisherService has the following subelements:
- ServiceMetadataPublisherID (1..1): xs:string holds the Unique Identifier of the SMP.
- ParticipantIdentifier (1..1): ids:ParticipantIdentifierType
 454 the Participant Identifier which has its services registered in the Service Metadata Publisher.
 455 See the "ParticipantIdentifier" section on the format.

456 3.2.3 ParticipantIdentifier datatype

457 Represents a Participant Identifier which has its service metadata held by a specific Service Metadata 458 Publisher.

- 462 ParticipantIdentifier has the following sub elements:
- ParticipantIdentifier (1..1): xs:string
 the participant identifier

467 3.2.4 ParticipantIdentifier format

- 468 For a description of the ParticipantIdentifier format, see the "Peppol Policy for use of Identifier"
- 469 document [PFUOI4].

470 3.2.5 ParticipantIdentifierPage datatype

- 471 Represents a page of ParticipantIdentifiers for which data is held by the Service Metadata
- 472 Locator service.

- ServiceMetadataPublisherID (1..1): xs:string
 holds the Unique Identifier of the SMP
- ids:ParticipantIdentifier (1..1): xs:string
 the participant identifier
- NextPageIdentifier (0..1): xs:string
 an element containing a string identifying the next page of ParticipantIdentifiers:

```
484 <NextPageIdentifier>
485 [ Identifier for_Next_Page ]
486 </NextPageIdentifier>
```

487 If no <NextPageIdentifier/> element is present, it implies that there are no further pages.

488 3.2.6 MigrationRecord

- 489 The MigrationRecord represents the data required to control the process of migrating a
- 490 ParticipantIdentifier from the control of one Service Metadata Publisher to a different Service
- 491 Metadata Publisher.

- 497 MigrationRecord has the following sub elements:
- ServiceMetadataPublisherID (1..1): xs:string holds the Unique Identifier of the SMP.

500 501	•	ParticipantIdentifier (11) : ids:ParticipantIdentifierType the participant identifier
502 503 504	•	MigrationKey (11): xs:string a string which is a unique key controlling the migration of the metadata for a given ParticipantIdentifier from one Service Metadata Publisher to another. The
505		MigrationKey string is a string of characters and numbers only, with a maximum length
506		of 24 characters.

4 Service Bindings

- 508 This section describes the Bindings of the services provided by the Service Metadata Locator to
- 509 specific transports.

507

510 4.1 Services Provided as Web services - characteristics

- 511 Some of the services described by this specification are provided through Web service bindings.
- 512 Where services are provided through Web services bindings, those bindings MUST conform to the
- relevant WS-I Profiles, in particular WS-I Basic Profile 1.1 and WS-I Basic Security Profile 1.0.

4.2 ManageParticipantIdentifier service - binding

- The ManageParticipantIdentifier service is provided in the form of a SOAP-based Web service.
- 516 4.2.1 Transport binding
- 517 The ManageParticipantIdentifier interface is bound to an HTTP SOAP 1.1 transport.
- See a WSDL for this in "Appendix B: WSDLs".
- 519 **4.2.2 Security**
- 520 The service is secured at the transport level with a two-way SSL/TLS connection. The requestor must
- authenticate using a client certificate issued for use in the infrastructure by a trusted third-party. For
- example, in the Peppol infrastructure, a Peppol certificate will be issued to the participants when
- 523 they have signed peering agreements and live up to the stated requirements. The server must reject
- 524 SSL/TLS clients that do not authenticate with a certificate issued under the Peppol root.

525 **4.3 ManageServiceMetadata service - binding**

- 526 Service Metadata Publishers use this interface to create or update metadata such as the endpoint
- address for retrieval of metadata about specific participant services.
- 528 The ManageServiceMetadata service is provided in the form of a SOAP-based Web service.
- 529 4.3.1 Transport binding
- 530 The ManageServiceMetadata interface is bound to an HTTP SOAP 1.1 transport.
- 531 See a WSDL for this in "Appendix B: WSDLs".
- 532 **4.3.2 Security**
- The service is secured at the transport level with a two-way SSL connection. The requestor must
- authenticate using a client certificate issued for use in the infrastructure by a trusted third-party.

5	DNS	Spoof	Mitigation
---	-----	--------------	------------

- The regular lookup of the address of the SMP for a given participant ID is performed using a standard
- 537 DNS lookup. There is a potential vulnerability of this process if there exists at least one "rogue"
- 538 certificate (e.g. stolen or otherwise illegally obtained).
- In this vulnerability, someone possessing such a rogue certificate could perform a DNS poisoning or a
- 540 man-in-the-middle attack to fool senders of documents into making a lookup for a specific identifier
- in a malicious SMP (that uses the rogue certificate), effectively routing all messages intended for one
- or more recipients to a malicious access point. This attack could be used for disrupting message flow
- for those recipients, or for gaining access to confidential information in these messages (if the
- messages were not separately encrypted).
- One mitigation for this kind of attack on the DNS lookup process is to use DNSSEC rather than plain
- DNS. DNSSEC allow the authenticity of the DNS resolutions to be checked by means of a trust anchor
- in the domain chain. Therefore, it is recommended that an SML instance uses the DNSSEC
- infrastructure.

6 Appendix A: XML Schema (non-normative)

This section defines the XML Schema types used in the interfaces. The normative version of the file is published together with this specification.

6.1 peppol-sml-types-v1.xsd
