Revision History

Version	Date	Description of changes	Author
1.0.0	2010-02-15	First version (pending EC approval)	Mikkel Hippe Brun, NITA
1.0.1	2010-10-01	EC approved	Klaus Vilstrup Pedersen, DIFI
1.1.0	2012-08-15	Make room for alternative Transport Protocols e.g. AS2	Klaus Vilstrup Pedersen, DIFI
1.2.0	2021-02-24	Updated the references	Philip Helger,
		Improved layout	OpenPeppol OO
		Explicitly allowing Content-Type "application/xml" as it is equivalent to "text/xml" (chapter 5.1)	
		Removing the requirement that the encoding attribute value is case sensitive (chapter 5.2)	
		Change "is not" to "MUST NOT" in chapter 5.5	
		Replaced the references to the BusDox Common Definition document (BDEN-CEDF)	
		Added clarifications on ServiceActivationDate and ServiceExpirationDate	
		Linking peppol-smp-types-v1.xsd in the Appendix	
		Fixed a typo in the name of the transformation	
		Changed the Canonicalization Algorithm from "Exclusive" to "Inclusive"

1 Introduction

2 1.1 Objective

1

8

12 13

14

21

- 3 This document describes the REST (Representational State Transfer) interface for Service Metadata
- 4 Publication within the Business Document Exchange Network (BUSDOX). It describes the
- 5 request/response exchanges between a Service Metadata Publisher and a client wishing to discover
- 6 endpoint information. A client could be an end-user business application or an Access Point. It also
- 7 defines the request processing that must happen at the client.

1.2 Scope

- 9 This specification relates to the Technical Transport Layer i.e. BusDox specifications. The BusDox
- specifications can be used in many interoperability settings. In the Peppol context, it provides
- transport for procurement documents as specified in the Peppol Profiles.

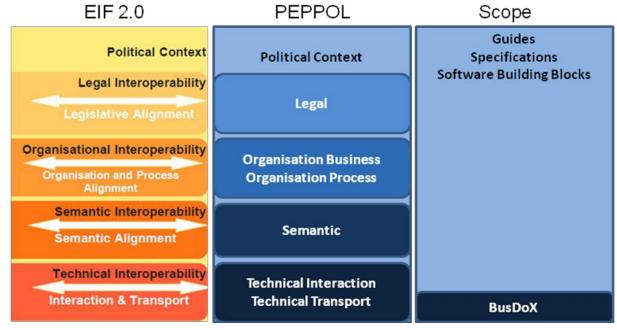

Fig. 1: Peppol Interoperability

1.3 Goals and non-goals

- 15 The goal of this document is to define the REST lookup interface that Service Metadata Publishers
- 16 ("SMP") and clients must support. Decisions regarding physical data format and management
- interfaces are left to implementers of such a service.
- 18 Service Metadata Publishers may be subject to additional constraints of agreements and governance
- 19 frameworks within instances of the BUSDOX infrastructure not covered in this specification, which
- 20 only addresses the technical interface of such a service.

1.4 Terminology

- The keywords "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD
- 23 NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as
- 24 described in RFC 2119 [RFC2119].

1.4.1 **Notational conventions**

26 Pseudo-schemas are provided for each component, before the description of the component. They use BNF-style conventions for attributes and elements: "?" denotes optionality (i.e. zero or one 27 occurrences), "*" denotes zero or more occurrences, "+" one or more occurrences, "[" and "]" are 28 29

used to form groups, and "|" represents choice. Attributes are conventionally assigned a value which 30 corresponds to their type, as defined in the normative schema. Elements with simple content are

conventionally assigned a value which corresponds to the type of their content, as defined in the 31

32 normative schema. Pseudo schemas do not include extension points for brevity.

```
33
     <!-- sample pseudo-schema -->
34
     <defined element
35
         required attribute of type string="xs:string"
         optional attribute_of_type_int="xs:int"? >
36
37
       <required element />
38
       <optional element />?
39
       <one_or_more_of_these elements />+
40
       [ <choice 1 /> | <choice 2 /> ]*
     </defined element>
41
```

2 The Service Discovery Process

- The interfaces of the Service Metadata Locator (SML) service and the Service Metadata Publisher
- 69 (SMP) service cover both sender-side lookup and metadata management performed by SMPs.
- 70 Business Document Exchange Network (BUSDOX) mandates the following interfaces for these
- 71 services:

67

72

73 74

75

76

78

88 89

90

91

92

93

- Service Metadata Locator:
 - o DNS-based resolve mechanism to locate individual SMPs
 - Management interface towards SMPs
- Service Metadata Publishers:
 - Discovery interface towards senders
- 77 This specification only covers the discovery interface for Service Metadata Publication services.

2.1 Discovery flow

- 79 For a sender, the first step in the Discovery process is to establish the location of the Service
- 80 Metadata relating to the particular Participant Identifier to which the sender wants to transmit a
- 81 message. Each participant identifier is registered with one and only one Service Metadata Publisher.
- The sender looks up the endpoint for the Service Metadata Publisher using the DNS-based Service
- 83 Metadata Locator service (this is a regular DNS resolve). The sender can then retrieve the metadata
- 84 associated with the Participant Identifier. This metadata includes the information necessary to
- 85 transmit the message to the recipient endpoint.
- 86 The diagram below represents the lookup flow for a sender contacting both the Service Metadata
- 87 Locator and the SMP.

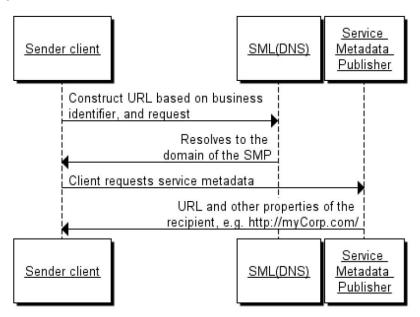

Fig. 2: Endpoint lookup with Service Metadata

Note: For optimization reasons, the discovery doesn't have to be performed for every transfer if the necessary information for transfer is already cached from previous transmissions. Though necessary exception handling has to be in place i.e. new lookup has to be performed if the sending shows that information is outdated e.g. old endpoint address.

2.1.1 Discovering services associated with a Participant Identifier

- 95 In addition to the direct lookup of Service Metadata based on participant identifier and document 96 type, a sender may want to discover what document types can be handled by a specific participant
- 97 identifier. Such discovery is relevant for applications supporting several equivalent business
- 98 processes. Knowing the capabilities of the recipient is valuable information to a sender application
- and ultimately to an end user. E.g. the end user may be presented with a choice between a "simple" and a "rich" business process.
- 101 This is enabled by a pattern where the sender first retrieves the ServiceGroup entity, which holds a
- 102 list of references to the ServiceMetadata resources associated with it. The SignedServiceMetadata in
- turn holds the metadata information that describes the capabilities associated with the recipient
- 104 participant identifier

115

116

117

118

2.2 Service Metadata Publisher Redirection

For each participant identifier, the SML may only point to a single SMP. There are cases however where the owner of a participant identifier may want to use different SMPs for different document types or processes. This is supported by Service Metadata Publisher Redirection.

In this pattern, the sender is redirected by the SMP to a secondary, remote SMP where the actual *SignedServiceMetadata* can be found. A special element within the *SignedServiceMetadata* record of the SMP points to the SMP that has the actual Service Metadata and certificate information for that SMP. The diagram below shows this flow:

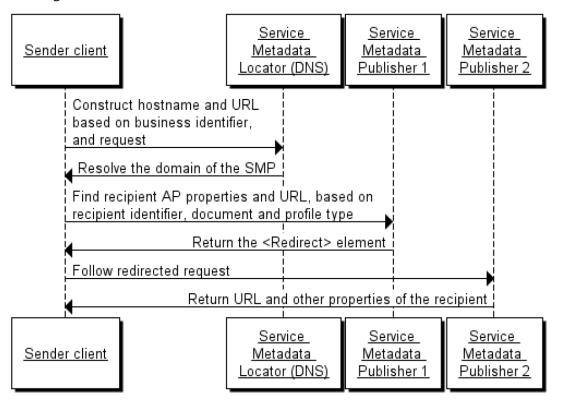

Fig. 3: Service Metadata Redirection

Note that only one degree of redirect is allowed; clients are not required to follow more than one redirect, i.e. a redirect resource cannot point to another redirect resource. Allowing one level of redirect permits the described use case to be realized, while avoiding the possibility of cyclic references and long chains of redirects

3 Interface model

- 120 This specification defines a REST-based interface for retrieving Service Metadata, but does not
- 121 specify interfaces for creating, updating, deleting and managing Service Metadata, or any internal
- data storage formats.
- 123 The goal is to allow the interface in this specification to expose data from many different Service
- Metadata back-ends, which may be based on any suitable technology such as for example RDBMS,
- 125 LDAP, or UDDI.

119

- Note that when adding or deleting Participant Identifiers in the SMP, an implementation of the SMP
- 127 will need to reflect its custody of a Participant Identifier in the SML. Please see the SML specification
- 128 [BDEN-SML] for a description of the processes and interfaces for doing this.

4 Data model

- This section outlines the data model of the interface. The data model comprises the following main data types:
- ServiceGroup

129

- ServiceMetadata / SignedServiceMetadata
- 134 Supporting data types for these main types are:
- ServiceInformation
- ServiceEndpointList
- ParticipantIdentifier
- DocumentIdentifier
- 139 Redirect
- Process
- ProcessList
- Endpoint
- 143 Each of these data types is described in detail in the following sections.

144 4.1 On extension points

- 145 For each major entity, extension points have been added with the optional <smp:Extension>
- 146 element.

150 151

152153

154

155

147 4.1.1 Semantics and use

- 148 Child elements of the <smp:Extension> element are known as "custom extension elements".
- 149 Extension points may be used for optional extensions of service metadata. This implies:
 - Extension elements added to a specific Service Metadata resource MUST be ignorable by any
 client of the transport infrastructure. The ability to parse and adjust client behaviour based
 on an extension element MUST NOT be a prerequisite for a client to locate a service, or to
 make a successful request at the referenced service.
 - A client MAY ignore any extension element added to specific service metadata resource instances.

156 **4.2 ServiceGroup**

- 157 The ServiceGroup structure represents a set of services associated with a specific participant
- identifier that is handled by a specific SMP. The ServiceGroup structure holds a list of references to
- 159 *SignedServiceMetadata* resources in the *ServiceList* structure.
- 160 Pseudo-schema for ServiceGroup:

```
161
      <smp:ServiceGroup>
162
        <ids:ParticipantIdentifier scheme="xs:string">
163
          xs:string
164
        </ids:ParticipantIdentifier>
165
        <smp:ServiceMetadataReferenceCollection>
166
          <smp:ServiceMetadataReference href="xs:anyURI" />*
167
        </smp:ServiceMetadataReferenceCollection>
168
        <smp:Extension>xs:any</smp:Extension>?
169
      </smp:ServiceGroup>
```

170 Description of the individual fields (elements and attributes).

Field	Description			
ServiceGroup	Document element			
ParticipantIdentifier	Represents the business level endpoint key and key type, e.g. a DUNS or GLN number that is associated with a group of services. See [PFUOI4] for information on this data type.			
ServiceMetadataReferenceCollection	This structure holds a list of references to SignedServiceMetadata structures. From this list, a sender can follow the references to get each SignedServiceMetadata structure.			
ServiceMetadataReference (0*)	Contains the URL to a specific SignedServiceMetadata instance - see the REST binding section for details on the URL format. Note that references MUST refer to SignedServiceMetadata records that are signed by the certificate of the SMP. It MUST NOT point to SignedServiceMetadata resources published by external SMPs.			
Extension	The extension element may contain any XML element. Clients MAY ignore this element. It can be used to add extended metadata to individual references to Service Metadata resources.			

4.2.1 Non-normative example

171

194

Non-normative example of a *ServiceGroup* resource:

```
<?xml version="1.0" encoding="utf-8" ?>
173
174
      <!--
175
      This sample assumes that the service metadata publisher resides at
      "http://serviceMetadata.eu/".
176
      It assumes that the business identifier is "0010:5798000000001".
177
178
      -->
179
      <ServiceGroup xmlns="http://busdox.org/serviceMetadata/publishing/1.0/"</pre>
180
      xmlns:ids="http://busdox.org/transport/identifiers/1.0/">
        <ids:ParticipantIdentifier scheme="busdox-actorid-upis">
181
182
          0010:5798000000001
183
        </ids:ParticipantIdentifier>
184
        <ServiceMetadataReferenceCollection>
185
          <ServiceMetadataReference href="http://serviceMetadata.eu/busdox-actorid-</pre>
186
      upis%3A%3A0010%3A5798000000001/services/busdox-docid-
187
      qns%3A%3Aurn%3Aoasis%3Anames%3Aspecification%3Aubl%3Aschema%3Axsd%3AInvoice-
      2%3A%3AInvoice%23%23UBL-2.0"/>
188
189
        </ServiceMetadataReferenceCollection>
190
        <Extension>
191
          <ex:Test xmlns:ex="http://test.eu">Test</ex:Test>
192
        </Extension>
193
      </ServiceGroup>
```

4.3 ServiceMetadata

195 This data structure represents Metadata about a specific electronic service. The role of the

196 ServiceMetadata structure is to associate a participant identifier with the ability to receive a specific

- document type over a specific transport. It also describes which business processes a document can participate in, and various operational data such as service activation and expiration times.
- The *ServiceMetadata* resource contains all the metadata about a service that a sender Access Point needs to know in order to send a message to that service.

201 4.3.1 Redirection

- 202 For recipients that want to associate more than one SMP with their participant identifier, they may
- 203 redirect senders to an alternative SMP for specific document types. To achieve this, the
- 204 ServiceMetadata element defines the optional element Redirect. This element holds the URL of
- the alternative SMP, as well as the Subject Unique Identifier of the destination SMPs certificate used
- 206 to sign its resources.

215

- In the case where a client encounters such a redirection element, the client MUST follow the first
- 208 redirect reference to the alternative SMP. If the SignedServiceMetadata resource at the alternative
- 209 SMP also contains a redirection element, the client SHOULD NOT follow that redirect. It is the
- 210 responsibility of the client to enforce this constraint.
- 211 Pseudo-schema for this data type:

Pseudo-schema for the ServiceInformation data type:

```
216
      <smp:ServiceInformation>
217
        <ids:ParticipantIdentifier scheme="xs:string">xs:string
218
        </ids:ParticipantIdentifier>
219
        <ids:DocumentIdentifier scheme="xs:string" />
220
        <smp:ProcessList>
221
          <smp:Process>+
222
            <ids:ProcessIdentifier scheme="xs:string" />
223
            <smp:ServiceEndpointList>
224
              <smp:Endpoint transportProfile="xs:string">+
225
                <wsa:EndpointReference />
226
                <smp:RequireBusinessLevelSignature>xs:boolean
227
                </smp:RequireBusinessLevelSignature>
228
                <smp:MinimumAuthenticationLevel>xs:string
229
                </smp:MinimumAuthenticationLevel >?
230
                <smp:ServiceActivationDate>xs:dateTime
231
                </smp:ServiceActivationDate>?
232
                <smp:ServiceExpirationDate>xs:dateTime
233
                </smp:ServiceExpirationDate>?
234
                <smp:Certificate>xs:string</smp:Certificate>
235
                <smp:ServiceDescription>xs:string
236
                </smp:ServiceDescription>
237
                <smp:TechnicalContactUrl>xs:anyURI
238
                </smp:TechnicalContactUrl>
239
                <smp:TechnicalInformationUrl>xs:anyURI
240
                </smp:TechnicalInformationUrl>?
241
                <smp:Extension>xs:any</smp:Extension>?
242
              </smp:Endpoint>
243
            </smp:ServiceEndpointList>
            <smp:Extension>xs:any</smp:Extension>?
244
245
          </smp:Process>
246
        </smp:ProcessList>
247
        <smp:Extension>xs:any</smp:Extension>?
```

Peppol Implementation Specification

Peppol Transport Infrastructure Service Metadata Publishing (SMP) 1.2.0

248 /smp:ServiceInformation>

249 Pseudo-schema for the Redirect data type:

253 <smp:Redirect>

The Extension element may contain any XML element. Clients MAY ignore this element. It can be

used to add extension metadata to the service metadata.

256 The href attribute of the Redirect element contains the full address of the destination SMP

record that the client is redirected to.

258 For example, assume that an SMP called "SMP1" has the address http://smp1.eu, and another

259 SMP called "SMP2" has the address http://smp2.eu, and a client requests a resource with the

260 following URL (note that these examples have been percent encoded):

261 http://smpl.eu/busdox-actorid-

262 | upis%3A%3A0010%3A579800000001/services/busdox-docid-

263 qns%3A%3Aurn%3Aoasis%3Anames%3Aspecification%3Aubl%3Aschema%3Axsd%3AInvoice

264 - 2%3A%3AInvoice%23%23UBL-2.0

We now assume that the owner of these metadata has moved them to SMP2. SMP1 would then

return a SignedServiceMetadata resource with a Redirect child element that has the href

267 attribute set to

266

269

268 http://smp2.eu/busdox-actorid-

upis%3A%3A0010%3A579800000001/services/busdox-docid-

270 qns%3A%3Aurn%3Aoasis%3Anames%3Aspecification%3Aubl%3Aschema%3Axsd%3AInvoice

271 - 2%3A%3AInvoice%23%23UBL-2.0

272 For the list of endpoints under each Endpoint element in the ServiceEndpointList, each

273 endpoint MUST have different values of the transportProfile attribute, i.e. represent bindings

to different transports.

275 Description of the individual fields (elements and attributes).

Field	Description		
/ServiceMetadata	Document element		
ServiceMetadata/Redirect	The direct child element of ServiceMetadata is either the Redirect element or the ServiceInformation element. The Redirect element indicates that a client must follow the URL of the href attribute of this element.		
Redirect/CertificateUID	Holds the Subject Unique Identifier of the certificate of the destination SMP. A client SHOULD validate that the Subject Unique Identifier of the certificate used to sign the resource at the destination SMP matches the Subject Unique Identifier published in the redirecting SMP.		

Field	Description
	Description
Redirect/Extension	The Extension element may contain any XML element. Clients MAY ignore this element. It can be used to add extension metadata to the Redirect.
ServiceMetadata/ServiceInformation	The direct child element of ServiceMetadata is either the Redirect element or the ServiceInformation element. The ServiceInformation element contains service information for an actual service registration, rather than a redirect to another SMP.
ServiceInformation/ParticipantIdentifier	The participant identifier. Comprises the identifier, and an identifier scheme. This identifier MUST have the same value of the {id} part of the URI of the enclosing ServiceMetadata resource. See the ParticipantIdentifier section of the 'Policy for use of identifiers' document [PFUOI4] for information on this data type.
ServiceInformation/DocumentIdentifier	Represents the type of document that the recipient is able to handle. The document type is represented by an identifier (identifying the document type) and an identifier scheme, which the format of the identifier itself. See the DocumentTypeldentifier section of the 'Policy for use of identifiers' document [PFUOI4] for information on this data type.
ServiceInformation/ProcessList	Represents the processes that a specific document type can participate in, and endpoint address and binding information. Each process element describes a specific business process that accepts this type of document as input and holds a list of endpoint addresses (in the case that the service supports multiple transports) of services that implement the business process, plus information about the transport used for each endpoint. See the Process section of the 'Policy for use of identifiers' document [PFUOI4] for information on the identifier format.
Process/ProcessIdentifier	The identifier of the process. See the 'Policy for use of identifiers' document for a definition of process identifiers [PFUOI4]
Process/ServiceEndpointList	List of one or more endpoints that support this process.
ServiceEndpointList/Endpoint	Endpoint represents the technical endpoint and address type of the recipient, as an URL.

Field	Description
Endpoint/EndpointReference	The address of an endpoint, as a WS-Addressing Endpoint Reference (EPR).
Endpoint/@transportProfile	Indicates the type of transport protocol that is being used between access points, e.g. the Peppol AS4 profile (peppol-transport-as4-v2_0). A list of valid transport protocols is referenced from the 'Policy for use of identifiers' document [PFUOI4].
Endpoint/RequireBusinessLevelSignature	Set to true if the recipient requires business-level signatures for the message, meaning a signature applied to the business message before the message is put on the transport. This is independent of the transport-level signatures that a specific transport profile, such as the Peppol AS4 profile, might mandate. This flag does not indicate which type of business-level signature might be required. Setting or consuming business-level signatures would typically be the responsibility of the final senders and receivers of messages, rather than a set of APs.
Endpoint/MinimumAuthenticationLevel	Indicates the minimum authentication level that recipient requires. The specific semantics of this field is defined in a specific instance of the BUSDOX infrastructure.
	It could for example reflect the value of the "urn:eu:busdox:attribute:assurance-level" SAML attribute defined in the START specification.
Endpoint/ServiceActivationDate	Activation date of the service. Senders MUST ignore services that are not yet activated.
	A missing activation date MUST be interpreted as "valid since forever".
	Format of ServiceActivationDate is xs:dateTime.
Endpoint/ServiceExpirationDate	Expiration date of the service. Senders MUST ignore services that are expired.
	A missing expiration date MUST be interpreted as "valid until eternity".
	Format of ServiceExpirationDate is xs:dateTime.
Endpoint/Certificate	Holds the complete signing certificate of the recipient AP, as a PEM (base 64) encoded X509 DER formatted value.
Endpoint/ServiceDescription	A human readable description of the service.

Field	Description
Endpoint/TechnicalContactUrl	Represents a link to human readable contact information. This might also be an email address.
Endpoint/TechnicalInformationUrl	A URL to human readable documentation of the service format. This could for example be a web site containing links to XML Schemas, WSDLs, Schematrons and other relevant resources.
Process/Extension	The Extension element may contain any XML element. Clients MAY ignore this element. It can be used to add extension metadata to the process metadata block as a whole.
ServiceInformation/Extension	The Extension element may contain any XML element. Clients MAY ignore this element. It can be used to add extension metadata to the service metadata.

276 4.3.2 Non-normative example

- 277 For a non-normative example of a ServiceMetadata resource, see the SignedServiceMetadata non-
- 278 normative example below.

4.4 SignedServiceMetadata

- 280 The SignedServiceMetadata structure is a ServiceMetadata structure that has been signed by the
- 281 SMP, according to governance policies that are not covered by this document. Pseudo-schema for
- this data type:

279

287

288

289

290

- ServiceMetadata is the ServiceMetadata element covered by the signature.
- Signature represents an enveloped XML signature over the SignedServiceMetadata element.

4.4.1 Non-normative example

291 Non-normative example of a *SignedServiceMetadata* resource.

386
      </SignedServiceMetadata>
```

5 Service Metadata Publishing REST binding

388 This section describes the REST binding of the SMP interface.

5.1 The use of HTTP

387

389

405

- 390 A service implementing the REST binding MUST set the HTTP Content-Type header, and give it a
- value of text/xml or application/xml. A service implementing the REST profile MUST NOT
- 392 use TLS (Transport Layer Security) or SSL (Secure Sockets Layer). An instance of the BUSDOX
- infrastructure MAY set restrictions on what ports are allowed.
- An implementation of the SMP might choose to manage resources through the HTTP POST, PUT and
- 395 DELETE verbs. It is however up to each implementation to choose how to manage records, and use of
- 396 HTTP POST, PUT and DELETE is not mandated or regulated by this specification.
- 397 HTTP GET operations MUST return the following HTTP status codes:

HTTP Status Code	Meaning
200	Must be returned if the resource is retrieved correctly.
404	Code 404 must be returned if a specific resource could not be found. This could for example be the result of a request containing a participant identifier that does not exist.
500	Code 500 must be returned if the service experiences an internal processing error.

- 398 The service MAY support other HTTP status codes as well.
- The service SHOULD NOT use HTTP redirection in the manner indicated by the HTTP 3xx codes.
- 400 Clients are not required to support active redirection.

401 5.2 The use of XML and encoding

- 402 XML document returned by HTTP GET MUST be UTF-8 encoded. They MUST contain a document type
- 403 declaration starting with <?xml which includes the encoding attribute set to UTF-8. Please
- observe that the content of the encoding attribute is not case sensitive. Version 1.0 of XML is used.

5.3 Resources and identifiers

406 The REST interface comprises 2 types of resources.

Resource	URI	Meth od	XML resource root element	HTT P Stat us	Description of returned content
ServiceGroup	/{identifier scheme}::{id}	GET	<servicegr oup></servicegr 	200; 500; 404	Holds the participant identifier of the recipient, and a list of references to individual ServiceMetadata resources that are associated with that participant identifier.

/{identifier	GET	<signedse< th=""><th>•</th><th>Holds all of the metadata</th></signedse<>	•	Holds all of the metadata
			/	about a Service, or a
vices/{docType}		data>	404	redirection URL to another
See section				Service Metadata Publisher
below for				holding this information.
{docType} format				
\ \	scheme}::{id}/ser vices/{docType} See section pelow for	scheme}::{id}/ser vices/{docType} See section pelow for	scheme}::{id}/ser rviceMeta vices/{docType} data> See section pelow for	scheme}::{id}/ser rviceMeta 500; vices/{docType} data> 404 See section pelow for

Fig. 4: Table of resources and identifiers

A service implementing the REST binding MUST support these resource types. It MUST provide access to these using the URI scheme of table in Fig. 3.

5.3.1 On the use of percent encoding

407

408

409

410

- When any types of BUSDOX identifiers are used in URLs, each section between slashes MUST be
- 412 percent encoded according to [RFC3986] individually, i.e. section by section.
- 413 For example, this implies that for an URL in the form of / {identifier
- scheme)::{id}/services/{docType} the slash literals MUST NOT be URL encoded.

415 5.3.2 Using identifiers in the REST Resource URLs

- 416 This section describes specifically how participant and document identifiers are used to reference
- 417 ServiceGroup and SignedServiceMetadata REST resources. For a general definition on how to
- represent participant and document identifiers in URLs, see [PFUOI4].
- For the URL referencing a ServiceGroup resource, the {identifier scheme}::{id} part
- 420 follows the participant identifier format described in the "ParticipantIdentifier" section of the 'Policy
- 421 for use of identifiers' document [PFUOI4].
- The following URL format is used:

423 /{identifier scheme}::{id}

- 424 In the reference to the SignedServiceMetadata or Redirect resources
- 425 (/{id}/services/{docType}), the {docType} part consists of {document type
- 426 identifier scheme \}:: \{ document type identifier \}. For information on the format
- 427 of {document type identifier}, see the DocumentIdentifier section of the 'Policy for use of
- 428 identifiers' document [PFUOI4].

429 5.3.3 Non-normative identifier example

- 430 We assume an SMP can be accessed at the URL http://serviceMetadata.eu.
- 431 A business with the participant identifier 0010:579800000001 would have the following
- identifier for the *ServiceGroup* resource:
- http://serviceMetadata.eu/busdox-actorid-upis::0010:579800000001
- 434 After percent encoding:
- 435 http://serviceMetadata.eu/busdox-actorid-upis%3a%3a0010%3a5798000000001
- In the case of a NES-UBL order, a *SignedServiceMetadata* or *Redirect* resource can then be identified by
 - Identifier format type: busdox-docid-qns
- Root namespace:

438

urn:oasis:names:specification:ubl:schema:xsd:Order-2

- Document element local name: Order
- Subtype identifier: UBL-2.0 (since several versions of the Order schema may use the same namespace + document element name)
- The document type identifier will then be:
- busdox-docid-qns::urn:oasis:names:specification:ubl:schema:xsd:Order-2::Order##UBL-2.0
- The document type identifier MUST be percent encoded as described in [RFC3986]. The above, non-
- 448 normative example is thus encoded to
- 449 busdox-docid-
- 450 qns%3A%3Aurn%3Aoasis%3Anames%3Aspecification%3Aubl%3Aschema%3Axsd%3AOrder-
- 451 2%3A%3AOrder%23%23UBL-2.0
- The entire URL reference to a SignedServiceMetadata or Redirect resource thus has the form
- 453 {URL to server}/{identifier scheme}::{id}/services/{document identifier type}::{rootNamespace}::{documentElementLocalName}[##{Subtype identifier}]
- The percent-encoded form of the identifier using the above example will then be
- 456 http://serviceMetadata.eu/busdox-actorid-
- 457 upis%3a%3a0010%3a579800000001/services/busdox-docid-
- 458 qns%3A%3Aurn%3Aoasis%3Anames%3Aspecification%3Aubl%3Aschema%3Axsd%3AOrder-
- 459 2%3A%3AOrder%23%23UBL-2.0
- Note that the forward slashes delimiting the individual parts of the REST resource identifier URL are
- 461 not percent encoded, since they are part of the URL.
- 462 5.3.4 Implementation considerations
- When a client is redirected to an SMP using the DNS-based SML scheme described in [BDEN-SML],
- 464 the HTTP Host header will be set to a value originating from the CNAME alias set in the SML
- 465 (http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.23). Implementations should be
- 466 prepared to accept requests with this "host" header value.

467 5.4 Referencing the SMP REST binding

- 468 For referencing the SMP REST binding, for example from SML records, the following identifier should
- be used for the version 1.0 of the SMP REST binding:
- 470 http://busdox.org/serviceMetadata/publishing/1.0/
- This is identical to the target namespace of the SMP schema.
- 472 **5.5 Security**
- 473 At the transport level, the service MUST NOT be secured.
- 474 5.5.1 Message signature
- The message returned by the service is signed by the Service Metadata Publisher with XML-Signature
- 476 according to the standard http://www.w3.org/TR/2002/REC-xmldsig-core-
- **477** 20020212/.
- 478 The signature MUST be an enveloped XML signature represented via a ds:Signature element
- 479 embedded in the SignedServiceMetadata element. The ds:Signature element MUST be
- 480 constructed according to the following rules:

404	_	The (Defended MIST on south), and Transferred being
481	•	The <reference> MUST use exactly one <transform> being:</transform></reference>
482		http://www.w3.org/2000/09/xmldsig#enveloped-signature
483	•	The <ds:keyinfo> element MUST contain an <ds:x509data> element with an</ds:x509data></ds:keyinfo>
484		<ds:x509certificate> sub-element containing the signer's X.509 certificate as PEM (base 64)</ds:x509certificate>
485		encoded X509 DER value.
486	•	The canonicalization algorithm MUST be
487		http://www.w3.org/TR/2001/REC-xml-c14n-20010315
488	•	The SignatureMethod MUST be
489		http://www.w3.org/2000/09/xmldsig#rsa-sha1
490	•	The DigestMethod MUST be
491		http://www.w3.org/2000/09/xmldsig#sha1
492	5.5.2	Verifying the signature
493	When	verifying the signature, the consumer has access to the full certificate as a PEM (base 64)
494	encoded X509 DER value within the dsSignature element. The consumer may verify the signature	
	_	ed A303 DER value within the assignature element. The consumer may verify the signature
495	by	
496	a)	extracting the certificate from the ds: X509Data element,
497	b)	verify that it has been issued by the trusted root,
498	c)	perform a validation of the signature, and
	٠,	F =

d) perform the required certificate validation steps (which might include checking

5.5.3 Verifying the signature of the destination SMP

expiration/activation dates and revocation lists).

499

500

501

502

503

504 505

506

For the redirect scheme, the unique identifier of the destination SMP signing certificate is stored at the redirecting SMP. In addition to the regular signature validation performed by the client of the destination SMP resources, the client SHOULD also validate that the identifier of the destination SMP signing certificate corresponds to the unique identifier which the redirecting SMP claims belongs to the destination SMP.

507

508 509

510

6 Appendix A: Schema for the REST interface

6.1 peppol-smp-types-v1.xsd (non-normative)

This section defines the XML Schema for all the resources of the REST interface. The normative version of the XML Schema is packaged together with this specification.

```
511
      <?xml version="1.0" encoding="utf-8"?>
